MENG-TSE (i.e., the teacher Meng; earlier, MENG-KO; Latinized by the Jesuits into MENCIUS), a Chinese sage, b. in the beginning of the 4th c. B.C., in the village of Tséou, in the present district of Shan-tung. He died about 317 B.C. Meng-tse is the greatest of the early Confucians. His father died while Meng-tse was very young; but he was educated with such admirable care by his mother that the phrase "mother of Meng" has become a proverb for an excellent preceptress. At this period China was divided into a number of states, all acknowledging the suzerainty of the emperor of Tseu. Meng-tse traveled to several courts, seeking to introduce his doctrines of "virtue" and "justice;" but unfortunately, as too frequently happens, he found that princes and great men did not admire these things so much as poor scholars. His conversations with rulers and state-functionaries, with his disciples and acquaintances, were taken down by his admirers. They form the *Hi-tsi*, otherwise called the book of Meng-tse—the fourth of the Four Books. See CONFUCIUS. Many of the thoughts are exquisitely true, suggestive, and subtle. Several translations of it have been published, but they fall far short of the energy, sententiousness, freshness, and vivacity of the original. One of the best is the Latin version of Stanislas Julien, 12 vols. (Paris, 1824). There is also an English one by Collie (Malacca, 1828), and another by Pauthier (Paris, 1851).

MENHA'DEN, *Alosa menhaden*, a fish of the same genus with the shad (q.v.), which is caught in great quantities on the coasts of New York and New England during the summer months, when it visits them for the purpose of spawning. Its length is from 8

to 14 inches; the color of the upper parts is greenish brown, the belly silvery, a black spot on the shoulder, the whole surface iridescent. The menhaden is not a very palatable fish, but is rich in oil, which is used by painters, and is considered superior to linseed oil. Great quantities of this fish are taken in some seasons, and are sold for manure, one fish being considered equal to a shovelful of barn-yard manure, and 2,500 sufficient for an acre of land.

MENIER, EMILE-JUSTIN, 1826–81; b. Paris; in early life studied with Arfila, Dumas, and Pelouze, to become versed in the science of chemistry. He established large laboratories at St. Denis, which he freely opened for the use of students and scientific men. In 1859 he founded an annual prize for researches into the nature and properties of drugs, and in 1864 organized a school of practical chemistry, devoting the sum of 10,000 francs to establish lecture-courses on this subject. In the town of Noisiel, he built at his own expense model schools for the entire population, and gave 10,000 francs to be distributed among the school teachers in the different departments of France who reported the largest attendance of scholars. At one time he was at the head of the most important wholesale drug and chemical business in France, situated in the old quartier du Temple, in Paris. Retiring from this business, he undertook the manufacture of chocolate on a grand scale, and laid the foundation for a colossal fortune. He founded his factories at Noisiel, where he established a thriving settlement of pretty and convenient houses for his operatives, with schools, a hospital, baths, and other institutions for health and comfort. His factories eventually reached a trade of $5,000,000 per annum, and M. Menier became one of the wealthiest men in France. He resided in Paris in a palatial dwelling in the parc Monceaux, where he gathered together a remarkable and highly valuable collection of objects of art and *vertu*. In 1879 he purchased the chateau of Noisiel for the sum of $2,000,000. He was also the owner in Nicaragua of a section of territory 25 m. sq., and another tract of 6,000 acres on lake Nicaragua. Here were his plantations of cocoa-trees, whose product he made into chocolate at his factories in Noisiel. In 1862 M. Menier was chairman of one of the international juries of the London exhibition; at the Paris exhibition of 1867 he was commissioner for the republics of Nicaragua and Costa Rica. During the Franco-Prussian war he organized an ambulance corps, and was present during several battles, caring personally for the wounded. In 1870 he entered political life, being elected a member of the conseil-general of Seine-et-Marne, and later was returned to the chamber of deputies. He was also one of the few Frenchmen who had been elected members of the Cobden club. M. Menier devoted much of his time and influence during the latter years of his life to establishing closer commercial relations between France and the United States, and was one of the principal promoters of the Franco-American treaty of commerce, which he sought strenuously, by means of intelligent and skillful agents, to render acceptable to the two countries. In this effort he had only been partially successful at the time of his death.

MENIFEE, a co. in e. Kentucky, bounded on the n.e. by the Licking, and s. by the Red river, both tributaries of the Kentucky; 450 sq.m.; pop. '80, 5,410. The surface is hilly and broken, but not unfertile. The chief products are Indian corn, wheat, and oats. Sheep-grazing is a prominent industry. Chief town, Frenchburg.

MENIN, a frontier t. of West Flanders, Belgium, on the left bank of the Lys, which separates it from France, 30 m. s.s.w. of Bruges. It was formerly fortified, but its works have been demolished, and it is now a dismal and lifeless town, with some manufactures. Pop. '76, 11,337.

MENINGI'TIS (Gr. *mēninx*, a membrane) is the term employed in medicine to designate inflammation of the arachnoid and pia-mater (the middle and innermost of the membranes investing the brain).

This disease has been divided into three stages—the symptoms of the first being those of excitement, resulting from inflammation; those of the second being those of compression, showing that an effusion of fluid into the arachnoid cavity has taken place; while those of the third stage vary according as convalescence or death is the result.

Meningitis is especially apt to occur in children of a tuberculous diathesis, in which case the disease is usually described as acute hydrocephalus (q.v.). Scarlatina, measles, and other diseases caused by a blood-poison, may induce it in children. In adult life, the disease may often be traced to the action of typhous and marsh poisons, to intemperance, sunstroke, mechanical injuries, etc.

When the disease is due to any of the above-named blood-poisons, or to any constitutional cause, little can be done effectually in the way of special treatment. When it arises from mechanical injuries, bleeding, calomel, active purgatives, and cold applications to the head are often of use. The patient should be kept on low diet, and all mental excitement should be most carefully avoided.

MENINGI'TIS (*ante*), inflammation of the meninges. The meninges are the three investing membranes of the brain and spinal cord: the dura-mater, which lines the internal surface of the cavities; the pia-mater, which is in contact with the nervous substance; and the arachnoid, lying between the other two. Meningitis is generally confined to the arachnoid and pia-mater. In the former it is *arachnitis*, and in the latter *pieitis;* but in whichever membrane the inflammation commences the diagnosis between the two is

either difficult or impossible, and therefore the name *meningitis* is most applicable to either or both. Inflammation of the cerebral meninges is called cerebral meningitis, and that of the spinal meninges, spinal meningitis. When the membranes of both brain and cord are involved, the affection is called cerebro-spinal meningitis. Inflammation of the substance of the brain is *cerebritis*, while inflammation of the spinal cord is *myelitis* (q.v.). *Meningitis* may be arranged under the following heads: 1. Inflammation of the dura-mater, or pachymeningitis. 2. Cerebral meningitis, acute and chronic, including rheumatic meningitis. 3. Tubercular meningitis. 4. Spinal meningitis, acute and chronic. 5. Cerebro-spinal meningitis. 1. *Inflammation of the dura-mater*, or pachymeningitis (so called because it is inflammation of the *thick*, tough membrane, the dura-mater), was first described by Virchow under the latter title, and also, in some cases, under that of hematoma of the dura-mater. The inflammation may be on the outer surface of the dura-mater next the osseous substance, but this form is of rare occurrence, and never takes place except from injuries or osseous growths; it is to the affection attacking the inner surface of the dura-mater—that covered by the outer layer of the arachnoid membrane—to which attention is here called. A principal characteristic is the formation of adventitious membranes, which appear to be repetitions of the arachnoid, resembling it in its spider-web structure, not being false membrane, but having blood-vessels, which after a while rupture and cause extravasation of blood, which collects in cysts, thus constituting the peculiar form called hematoma of the dura-mater. In some cases there are as many as twenty layers of membrane. The extent covered by these cysts varies. They are generally oval, four or five inches long and a half an inch or more in thickness, containing from one ounce to sometimes more than a pound of blood. The brain beneath is, of course, compressed, anæmic, and often softened. The symptoms are, primarily, those of inflammation, and secondarily, those of pressure. The diagnosis is exceedingly difficult, and the termination is usually fatal. 2. *Cerebral meningitis.* Acute cerebral meningitis is not of very common occurrence, but nevertheless of great importance. The inflammation is of the same character as that which attacks other serous membranes—redness, with serum, coagulated fibrine or lymph, and pus; but these products are beneath, and not upon the surface of the arachnoid; in other words, they are deposited in the meshes of the pia-mater. Generally both hemispheres are involved, constituting what is called a bi-lateral affection. Post mortem examination often discloses the existence of serum beneath the arachnoid, but this may follow atrophy or anæmia. The condition most to be relied on is lymph, in sufficient quantity to be seen, or pus. The affection may be caused by injuries to the head, sometimes by exposure to the sun. Indulgence in spirituous liquors is not an infrequent cause. Acute cerebral meningitis sometimes occurs in connection with acute rheumatism of the joints, and is then called rheumatic meningitis and cerebral rheumatism; and it is regarded as being produced by the same causes which produce arthritic rheumatism. Acute meningitis may be mistaken for cerebral congestion, and after recovery in cases where the disease has not passed into the second stage, that of compression, it is often impossible to be certain as to what the affection has been, congestion or inflammation. Typhoid fever has been mistaken for meningitis, when there has been much delirium, but the presence of diarrhea, tenderness and gurgling on pressure in the right iliac region in typhoid fever, and the continuance of delirium in the latter affection, are sufficient to mark the distinction. Acute mania has some symptoms like those of acute meningitis, but there is not that morbid acuteness of the senses; moreover, in mania, fever and the symptoms of compression do not follow the delirium. Acute meningitis is a very dangerous disease, some cases ending fatally in 36 hours; but the fatal cases rarely extend beyond 9 days. The most unfavorable symptoms are coma (q.v.), difficulty of swallowing, feebleness of pulse, and want of nervous sensibility (anæsthesia). Recovery frequently takes place after there has been strabismus (see SQUINTING, *ante*), paralysis, and convulsions, but as a rule more than half of the cases terminate fatally.

Chronic cerebral meningitis, unconnected with a tuberculous condition, is not of frequent occurrence, although not so rare as the acute form. In most instances it is a sub-acute affection from the commencement, and is very insidious in its character, the symptoms being such as not to strongly attract attention. There is pain in the head, but not usually violent, and the febrile symptoms are unimportant. Vomiting is common, but as all these symptoms accompany other diseases, it is difficult to make the distinction. There is often a degree of stupidity or apathy, accompanied by irritability when aroused, and which, taken in connection with all the other symptoms and the circumstances attending the inception of the disease, furnish to the experienced practitioner data for forming in most cases a correct judgment. 3. *Tuberculous meningitis.* The recognition of this form of meningitis is due to Guersaut in 1823, and Gerhard and Rufz in 1833. Post-mortem examination reveals usually at the base of the brain beneath the arachnoid a fibrinous exudation, covering the pons-varolii, optic commissures and cerebellum; but the most prominent feature is the presence of numerous minute granulations having the appearance of gray tubercles, such as are found in the lungs and spleen in tuberculosis. These miliary tubercles, as they are called, are in the tract of the cerebral vessels, and according to Bastian and others within sheaths which are peculiar to the blood-vessels of the brain, and called perivascular sheaths, because surrounding the blood-vessels. (These perivascular sheaths are also found in the liver, q.v.). The symp-

toms are somewhat intermediate between those of acute and chronic simple meningitis, but the affection is frequently preceded by signs of tubercles in the lungs. It generally attacks children between 2 and 7 years of age, rarely appearing during the first year, but it is not confined to childhood. It usually commences with pain in the head, generally in the forehead. Vomiting is a frequent and early symptom, and there is more fever than in simple chronic meningitis. Remissions usually take place daily, with increased symptoms during the night. Sometimes the headache is very severe, attended by a short, sharp cry which has been called the "cephalic cry." There is great sensibility to light and sound. The pupils, in this the first stage, are contracted, and the conjunctiva suffused. A prominent symptom is the flushed face which comes on in paroxysms, often preceding convulsions. In the second stage there is drowsiness and less headache, although lancinating pains often occur. The pulse becomes less frequent, sometimes falling below the natural standard, and is often fluctuating and irregular. The respiration also becomes irregular. The pupils are dilated, and not infrequently unequal in size. Strabismus and oscillation of the eyeballs sometimes occur, and the patient often lies with the lids partially or widely open. There is often paralysis of one side of the face, and sometimes, more or less, of one side of the body. The muscles of the back of the neck often have tonic contractions, and there are sometimes contractions of the muscles of the limbs. There is almost always obstinate constipation in consequence of the sluggish and deranged condition of the nervous system, and there is generally retention of urine. The duration varies from 1 to 3 weeks and is almost invariably, some say invariably, fatal. 4. *Spinal meningitis.* This disease, like cerebral meningitis, may be acute or chronic, and it is also rare; excluding cases arising from injury, even more rare than the cerebral affection. The pathological conditions are similar to those in cerebral meningitis, but the symptoms are somewhat different, owing to effects manifested through the spinal nerves. Pain is felt in the spine, passing to the extremities, and it is increased by movements of the body more than by pressure over the spinal column, and there is great increase of sensibility of the surface of the body. The pain is referable to the posterior roots of the cord. Muscular contractions are referable to excitation by the disease of the anterior roots, sometimes causing the bending of the body backwards, producing the condition known as opisthotonos (q.v.). Sometimes the thoracic muscles are the subject of tonic spasm, causing great difficulty of breathing (dyspnœa). These are the early symptoms; subsequently paralysis and other symptoms follow, constituting the second stage. Acute spinal meningitis is rapid in its course, generally terminating fatally within 8 or 10 days. Asphyxia is the usual mode of death, in consequence of spasm of the respiratory muscles, or, more frequently perhaps, from paralysis of the respiratory nerves.

5. *Cerebro-spinal Meningitis.* This disease usually occurs as an epidemic, idiopathic cases being very rare. The epidemic form is a consequence of blood poisoning, and is a very dangerous affection which has sometimes extensively prevailed in different parts of the United States and Europe. It has sometimes received the name of spotted fever in consequence of the appearance of certain spots upon the skin in the course of the attack, but the spots are not constant accompaniments. The latter name was applied to an epidemic which prevailed in New England between the years 1807 and 1816, from the symptoms of which, as described, there is scarcely any doubt it was what is now called cerebro-spinal meningitis. This disease has been considered by some as a variety of typhus fever, but its greater suddenness and the absence of the characteristic mulberry rash of typhus prevent the general adoption of this view. The disease is usually ushered in with a chill followed by violent headache, vertigo, vomiting, and muscular rigidity passing into tetanus. There is here also, as in the other acute meningeal affections, increased sensitiveness of the skin; the face is pale, the pupils contracted, and the conjunctiva red. There is delirium, and usually as early as the second day in the more severe cases the extensor muscles of the neck and back are strongly contracted. The delirium soon passes into coma. According to Wunderlich there are three forms. In the first, the most rapidly fatal, the temperature rises at the approach of death to 108° F. and continues to rise for some hours after death. In the second form the fever has an irregular course and short duration. The third form is protracted and with great variations in temperature. In the commencement of an attack of cerebro-spinal meningitis the pulse is often slower than in health, but sometimes is more frequent. It increases with the disease, but generally does not exceed 100 beats per minute till towards the fatal termination, when it became very frequent. Headache is one of the most prominent symptoms. It was wanting in only one of 64 cases analyzed by Ames. The pain is intense, lancinating, and may be seated in the forehead, occiput, or the whole head. It is increased by noise, light, and the motions of the body, and is persistent. There is usually pain also in the spine, but not always throughout its whole length, and the probability is that the pain corresponds in location with the seats of the inflammation. In the less severe cases the delirium is rather slower in being developed, and varies much in intensity. At first the patient appears stupid, and sometimes remains so, but often becomes wildly delirious, and struggles with his attendants. As a rule there is obstinate constipation in consequence of the semi-paralyzed or deranged condition of the nervous system. The tongue varies in appearance, sometimes being large and flabby, and showing marks made by the teeth. As the disease progresses it becomes dry and dark. Petechial spots are frequently

observed, but they are not constant, and accompanying some epidemics more than others. They vary in size from a pin's head to a quarter of an inch or more, and are regarded as being due to an extravasation of hematine. They are of the nature of the ecchymoses which occur in scorbutus, purpura, and some cases of continued fever, and do not constitute a specific eruption. According to Tourdes, however, a rose-colored papular eruption, resembling that of typhoid fever, sometimes appears. The duration of the disease varies. Of fatal cases observed by Tourdes the shortest duration was 20 hours. Ames states the shortest duration to be 15 hours. The longest duration of fatal cases is stated by Tourdes to be 100 days. Of 160 cases analyzed by Dr. S. B. Hunt 12 died within the first 24 hours; 92 died before the end of the fifth day: 14 before the end of the tenth; 4 before the end of the fifteenth, and 18 survived for shorter or longer periods. Some writers regard the disease as belonging to the class of fevers instead of primarily to the nervous system, and this is probably the correct view. Boudin, in 1849, proposed to call it cerebro-spinal typhus. It attacks all ages, but the larger number of cases occur between 20 and 30 years, and the liability is rather small before 7 years. Males are more frequently the subjects than females, but the difference is not great. It prevails more in the winter and spring than during the summer. It is stated to be a disease of confined quarters, such as barracks and prisons. From 1837 to 1842 it prevailed in most of the crowded barracks of France, and has been a frequent visitor of the galley slaves at Toulon.

MENIP'PUS, one of the most noted of the cynic philosophers, and a pupil of Diogenes, was born at Gadara, in Syria, and flourished in the 1st c. B.C. He was originally a slave, and acquired considerable wealth by usury, but lost it all again, in consequence of which he strangled himself out of mortification. He satirized the philosophers of his time in terms so severe that the most biting satires were afterwards designated Menippean. Lucian pronounces him "the greatest snarler and snapper among all the old dogs" (the cynics). His works were thirteen in number, according to Diogenes; they are all lost.

MENISPERMA'CEÆ, a natural order of exogenous plants, mostly tropical and subtropical; creeping and twining shrubs, the wood of which is frequently disposed in wedges, and without the zones usual in exogenous stems. The leaves are alternate, generally simple, destitute of stipules; the flowers small, unisexual, often in large panicles or racemes. There are about 200 known species, including those which by some botanists have been formed into the two small separate orders *schizandraceæ* and *lardizabalaceæ*. The true menispermaceæ are generally bitter and narcotic; some of them are very poisonous, and some are valuable in medicine. See CALUMBA, CISSAMPELOS, and COCCULUS.

MENNO, SIMONS, the founder of the later school of Anabaptists (q.v.) in Holland, was born at Witmarsum, in Friesland, in 1496; took orders in 1524, and officiated for some years as a priest, first in the village of Pinjum, and afterwards in his native place. The study of the New Testament, however, about the year 1530, excited grave doubts in his mind regarding the truth both of the doctrine and constitution of the church; and in 1536 he withdrew from it altogether. He now attached himself to the party of the Anabaptists, was re-baptized at Leeuwarden, and appointed a teacher and bishop at Gröningen. Henceforth his great endeavor was to organize and unite the scattered members of the Anabaptist sect in Holland and Germany. With this design he spent much time in traveling; but Friesland was his chief residence until persecution compelled him to flee to Wismar. Finally he settled at Oldeslohe, in Holstein, where he found not only protection, but even encouragement, and was allowed to establish a printing-press for the diffusion of his religious opinions. Here he died in 1561. He was a man of gentle, earnest, modest, and spiritual nature, with no trace about him of the wild fanaticism of the earlier Anabaptists. His book of doctrine, entitled *Fundamentbuch von dem rechten Christlichen Glauben*, was published in 1539. See ANABAPTISTS.

MEN'NONITES, deriving their name from Simon Menno, are claimed by some Baptists as their predecessors, coming down directly from the Waldenses; but this claim is denied generally by other Protestant denominations, who regard the Mennonites simply as the followers of Menno, who, in the 16th c. drew together the better class of the Anabaptists under new rules, and expounded to them the principles of revealed truth. As thus instructed they professed belief in the personal reign of Christ on the earth during the millennium; in the unlawfulness of oaths, of war—even in resisting violence and wrong,—of lawsuits, and of allowing civil magistrates to be members of the church. All immoral practices they, as a denomination, condemned; and in their own conduct were exemplary, prudent, and devout. So far from being guilty of the excesses which have made the name Anabaptists odious, they are numbered by some writers among the best Christians which the church ever knew, and the best citizens which the state ever had. Menno, in order to unite his followers together, separated them from all other Dutch and German Protestants and gave them a regular system of church order. His statements of doctrine were so explained and modified that they resembled strongly the general system of the reformed churches, and thus greatly promoted the growth and influence of his followers. The stringent discipline which he maintained soon produced divisions in the flock. The parties formed were known by various names, as the fine

and the coarse, denoting different degrees of strictness in discipline, the Flandrians and Waterlanders, named from the districts in which the disputants lived; the orthodox—called from their leader, Dr. Samuel Apostool, Apostoolians—and the remonstrants were divided in their views concerning vital doctrines.

I. The Dutch Mennonites. William, prince of Orange granted the Mennonites a settlement in the United Provinces near the end of the 16th century. In 1626 their confession of faith was published; in 1626 an association was formed among them, and was strengthened in 1649, which in its organization resembled in some respects that of the present Congregationalists in the United States. As a result of this fellowship some of the rigorous rules of Menno and his successors were softened and improved. Each congregation chose its own pastor who was called an exhorter, and, not being supported by his people, provided for himself in the best way he could by engaging in business or trade. Where no pastor could be obtained, the deacon and deaconess ministered respectively to the men and women. In the 17th and 18th c. persecution drove many of the Mennonites from Germany and Switzerland to Holland, so that at one time the denomination, in what they regard as their parent country, contained at least 160,000 persons. In 1735 their theological seminary was established at Amsterdam, the students of which receive instruction in a part of the chapel that also contains the library. A knowledge of Latin and Greek is a necessary qualification for admission; the lectures are in Latin, and instruction is provided in Hebrew, church history, physics, moral philosophy, and kindred studies. This institution was at first supported by contributions obtained in Amsterdam alone, but now churches in other places also send aid. All the students have the ministry in view, and some of them receive aid from a public fund. The educated ministry thus provided has made the denomination respectable among other Protestants, and has raised up theologians that are highly esteemed. In 1795 they obtained equality in law among other Protestants, and have since gradually formed themselves into one national body. In 1811 they united in forming a society to promote theological education. A foreign missionary society also receives general support.

II. The Mennonites were numerous in Germany in the 17th century. In Moravia alone they amounted so 70,000. In 1622 they were expelled by Ferdinand II., and after a brief sojourn in Hungary and Transylvania removed to Russia. They were very numerous in eastern Prussia, especially at Dantzic, Marienburg, and Elbing, where their cleanliness and industry soon transformed desolate marsh grounds into gardens. But persecution compelled many of them to flee until after 1732, when the king removed some restrictions from them, so that they gradually increased again in numbers until 1789, when the right to acquire property in land was taken away, yet with all their hindrances they have maintained themselves in some parts of Prussia and have especially made the valley of the Vistula "the garden spot of the land."

III. In 1786 Catharine II. invited the Mennonites to settle in Russia with other German emigrants, and between that time and the close of the century about 350 families found there a home, on and near the island of Khortiz, in the lower Dnieper. The privileges pledged to them were: Protection from all attacks; freedom of worship; a gift of 190 acres of land for each family; exemption from taxation for ten years; money for their journey; money and wood with which to establish themselves; freedom of trade and manufactures; the administration of oaths in their own way, and perpetual exemption from military service. These great advantages induced a large and constant Mennonite immigration into Russia until 1817, the new colonists settling near their brethren in the government of Taurid, and between the rivers Molotchua, Dnieper, and Tokmak; and from that time they continued to increase in numbers and prosperity. They were always protected and favored by the government, and, chiefly through the character and efforts of Johann Cornies, preserved uninjured their German institutions and habits. This remarkable man, without office or rank, though both were once and again offered him by the government, exerted a very great influence over his countrymen and over the government in their behalf. Through his efforts, besides having their own schools and churches, and retaining their native language and ways of living, they enjoyed also a kind of popular government among themselves; each group of towns being under a magistrate chosen by themselves from among themselves, and forming the organ of communication between them and the imperial government. In 1861 the late emperor, Alexander II., gave new lands and confirmed all the old concessions to a colony of Mennonites who established themselves on the Volga. These lands, indeed, as well as those which Catharine had given, were not altogether without restriction. The holders could bequeath them to their children or sell them to any of their own community, but could not part with them to any one except a Mennonite unless by express permission from the government. But within the last decade the conduct of the imperial government towards this community as well as towards other colonists has been greatly changed. In June, 1871, an edict, addressed to all the colonists in the empire—German Lutherans and Roman Catholics, as well as Mennonites, Bulgarians, and others to whom lands and privileges had been given—limited the period of exemption from military service to ten years, with the proviso that, as to furnishing recruits, the laws ruling colonists should continue in force only till the publication of a general law on military duty. As such a law might be issued at any time, the Mennonites, with the rest, might be compelled to furnish recruits, notwithstanding their belief in the unlawfulness of war. The general

law of Russia does not allow emigration, but in this instance ten years were allowed for any to leave the empire who were unwilling to comply fully with the laws. Inquiries were at once commenced by some of the leading Mennonites concerning the best location for a new home. Many answers highly favorable having been received from several parts of the United States and Canada, and circulated widely among the people, the sum of $20,000 was raised by their voluntary contributions to send a delegation to visit the most promising regions of America and report the result of their observations on their return.

IV. The first Mennonites came to the United States in 1683, influenced doubtless by the sentiments which the society of Friends held in common with them, William Penn invited them to settle in his new province of Pennsylvania. Accepting the kind offer, 500 families within half a century made there their homes. In 1708 they built a school and church in Germantown. In the following year another colony settled in what is now Lancaster county, and was strengthened by other families in several successive years, so that in 1735, 500 families were found in that county alone. Afterwards their descendants emigrated to various places in Maryland, Ohio, New York, Indiana, and Canada. At the present time, while they are most numerous in the states already mentioned, some of them are found in nearly every part of the land. The results of the visit of the Russian delegation are very apparent in the arrival of large numbers of families who have bought lands on the prairies of the west and in the southern states; and they, probably, are the advance guard of all the Russian Mennonites. As they do not publish their statistics, accurate statements concerning their numbers cannot be made. They have a publishing house at Elkhart, Ind. Their bishops, ministers, and deacons are all chosen by lot and meet semi-annually in district conferences, Their pastors give their services gratuitously. Their confession of faith was translated and published at Philadelphia in 1727. Besides the main body of the denomination there are in America: 1. The *Reformed*, or strict Mennonites, who in 1811 seceded from the rest and profess to maintain strictly the dicipline of Simon Menno. 2. The *New* Mennonites organized in 1847 by about a dozen ministers of the old denomination. 3. The *Evangelical* Mennonites, who in 1856 seceded from the previous secession. 4. The *Amish* Mennonites, who greatly resemble the Reformed, and are sometimes called Hookers, because they substitute hooks for buttons on their clothes. They concern themselves but little in political matters, sometimes voting at elections when school officers are to be chosen. They have no denominational schools or religious paper, but send their children to the public schools and depend for religious literature on the regular Mennonites. See ANABAPTISTS; MENNO; *ante*.

MENOBRANCHUS, PROTEUS OF THE LAKES, or FISH LIZARD, a genus of batrachians belonging to the division of perenibranchiate amphibia of the order amphipneusta, which also includes the European proteus. See PROTEUS, *ante*, the axolotl (q.v.), amphiuma (q.v.), siren (q.v.), menophome (q.v.) The menobranchus has a large head and mouth; both upper jaw and palate armed with small sharp teeth; three branchial tufts on each side of the short neck; tail compressed laterally and fringed with a membrane; four limbs, each four-toed, the toes having no nails; small eyes without lids; large tongue, movable only at tip; nostrils small and near the lip, which is fleshy; body long and covered with a smooth skin. The most common species is *M. maculatus*, or spotted menobranch, which has an ashy gray color with darker spots and a brown stripe extending from the snout over the eyes. It inhabits the great lakes of North America and lake Champlain. Another species, *M. lateralis*, is dark brown above, and it has dark bands extending from the nostrils through the eyes and along the sides to the tail; the color of the belly is a dirty reddish brown, and the body is more slender than in *M. maculatus*. It is found in the Ohio river and other tributaries of the Mississippi on the eastern side, from Pennsylvania to Tennessee.

MENOMI'NEE, a co. in the s.w. part of the upper peninsula of Michigan; bounded s.e. by Green bay, and s.w. in its entire extent by Menominee river, which separates it from Wisconsin; drained also by Cedar river; 1350 sq.m.; pop. '70, 1791. It is traversed by the Chicago and Northwestern railroad. The surface is uneven and covered with extensive pine forests. The climate is cold. Lumber is the chief export, and there are four large saw-mills in operation. A great part of the population are engaged in iron mines and marble quarries. Chief town, Menominee.

MENOMO'NEE, a t., the co. seat of Dunn co., Wisconsin; on the Red Cedar river and on the West Wisconsin railroad; 25 m. n.w. of Eau Claire, and 42 m. n.e. of Red Wing, Minn.; pop. 3,433. There is a large trade in lumber and in furs; several carriage and machine shops, a sash factory and several brick yards. The town has the county court-house, 2 excellent public schools, 7 churches, and there are two weekly papers.

MENOMONEES, or MENOMINEES, a tribe of Indians first described near the Menominee river in Wisconsin, which empties into Green bay. The name, both of the river and the tribe, is synonymous with wild rice, which is found in great abundance near the mouth of the river, and was an important part of their food. Fathers Allouez and André established a mission among them in 1670, and describe them as lighter in complexion than the neighboring tribes. They remained allies of France in the wars with the English, aided in the relief of Detroit in 1712, and were a part of

the French-Indian forces until the time of the revolutionary war, when a part of the tribe went over to the English. In the war of 1812 they again were with the English, and aided in the capture of Mackinaw that year, and under their chief Souligny formed a part of the Indian force in command of the great chief Tecumseh at the siege of fort Meigs, on the Maumee, in 1813, and of the party repulsed by col. Croghan at Sandusky about the same time. Mar. 30, 1817, their chiefs by treaty ceded grants of land to Clarke, Edwards, and Choteau. Successive treaties were made between them and the U. S. government in 1825, 1827, 1831, 1836, 1848, 1852, and 1854. By the last they are in possession of a reservation on the upper Wolf and Oconto rivers in Wisconsin, 50 m. from Green bay, containing 240,400 acres. Their numbers decrease rapidly; in 1822, estimated, 3,900; in 1872, 1480. The Menomonees are one of the Algonquin tribes.

MEN'OPOME, *Protonopsis horrida*, one of the largest of batrachians, found in the Ohio and other rivers of the same region, and known on their banks by many names, such as hellbender, mud devil, ground puppy, young alligator, and tweeg. In form it resembles the newt and salamander; the head is flat and broad; the teeth in two concentric rows in the upper jaw; and one row in the lower, numerous and small; it is about 2 ft. long, and of a slaty gray color, with dark spots. Notwithstanding its small teeth it is fierce and voracious, feeding chiefly on fish and batrachians; and partly from its habits, partly from its ugliness, is much disliked by the fishermen of the Ohio, who erroneously regard it as venomous.

MENSES. See MENSTRUATION, *ante*.

MEN'SHIKOFF, or MENSCHIKOFF. See MENCHIKOW, or MENCHIKOFF, *ante*.

MENSTRUA'TION is the term applied to the discharge of blood which issues every month from the generative organs of the human female during the period in which she is capable of procreation.

The first appearance of this discharge, to which the terms *menses* and *catamenia* (each having reference to the monthly period) are indiscriminately applied, is a decided indication of the arrival of the period of commencing womanhood, and is usually accompanied by an enlargement of the mammary glands, and other less important changes. In this country, menstruation usually commences between the 14th and the 16th years, and terminates between the 48th and 52d years. The interval which most commonly elapses between the successive appearances of the discharge is about four weeks, although it is often shorter; and the duration of the flow is usually three or four days, but is liable to great variations. The first appearance of the discharge is usually preceded and accompanied by pain in the loins and general disturbance of the system, and in many women these symptoms invariably accompany the discharge. As a general rule there is no menstrual flow during pregnancy and lactation, and its cessation is one of the first signs that conception has taken place.

MENSURA'TION, the name of that branch of the application of arithmetic to geometry which teaches, from the actual measurement of certain lines of a figure, how to find by calculation, the length of other lines, the area of surfaces, and the volume of solids. The determination of lines is, however, generally treated of under trigonometry (q.v.), and surfaces and solids are now understood to form the sole subjects of mensuration. As the length of a line is expressed by comparing it with some well-known *unit* of length, such as a yard, a foot, an inch, and saying how many such units it contains, so the extent of a surface is expressed by saying how often it contains a corresponding superficial unit, that is, a square whose side is a yard, a foot, an inch; and the contents of solid bodies are similarly expressed in cubes or rectangular solids having their length, breadth, and depth, a yard, a foot, an inch. To find the length of a line (except in cases where the length may be calculated from other known lines, as in trigonometry) we have to apply the unit (in the shape of a foot-rule, a yard measure, a chain), and discover by actual trial how many units it contains. But in measuring a surface or a solid we do not require to apply an actual square board, or a cubic block, or even to divide it into such squares or blocks; we have only to measure certain of its boundary-lines or *dimensions;* and from them we can calculate or infer the contents. To illustrate how this is done, suppose that it is required to determine the area of a rectangular figure ABCD, of which the side AB is 7 in., and the side AC 3 inches. If AC be divided at the points F and E into 3 portions, each 1 inch long, and parallels be drawn from F and E to AB or CD; and if AB be similarly divided into 7 parts, of 1 inch each, and parallels be drawn to AC or BD through the points of section, then the figure will be divided into a number of equal squares or rectangular figures, whose length and breadth are each 1 inch; and as there are 3 rows of squares, and 7 squares in each row, there must be in all 7×3, or 21 squares. In general terms, if a and b be the lengths of two adjacent sides, there are a rows of little squares, and b squares in each row. Hence *the area of a rectangle = the product of two adjacent sides.*

The areas of other figures are found from this, by the aid of certain relations or properties of those figures demonstrated by pure geometry; for instance, the area of a parallelogram is the same as the area of a rectangle having the same base and altitude, and is therefore equal to the base multiplied by the height. As a triangle is half of a parallelogram, the rule for its area can be at once deduced. Irregular quadrilaterals and polygons are

measured by dividing them into triangles, the area of each of which is separately calculated. For the area of the circle, see CIRCLE. By reasoning similar to what has been employed in the case of areas, it is shown that the volume of a rectangular parallelopiped or prism is found in cubic inches by multiplying together the length, breadth, and depth in inches; and the oblique parallelopiped, prism, or cylinder, by multiplying the area of the base by the height.

MENTAL PHILOSOPHY. See MIND.

MENTA'NA, BATTLE OF, Nov. 3, 1867. On Oct. 28 and 29 a detachment of French troops, under gen. de Failly, landed at Civita Vecchia, a seaport town of Italy. Garibaldi, who was before the Roman gate of St. Jean, had defeated the pontifical troops at Monte Rotondo, 17 m. n.w. of Rome, with 4 battalions of volunteers; and, proposing to gain possession of Rome and join the papal states to the kingdom of Italy, was intending to proceed there forthwith, but hearing of the approach of the French brigade he fell back to Monte Rotondo and Mentana, in order to raise defenses. On Nov. 2 he advanced in 2 detachments, one toward Correse and one toward Tivoli. The Tivoli column, meeting the French troops, 2,000 men under Kanzlar and Polhès, led by 3,000 of the pontifical troops, fell back to Mentana, 13 m. n.e. of Rome; were pursued by the enemy; and on Sunday, Nov. 3, an engagement of 4 hours followed, ending in the defeat of the volunteers. The French in this battle made the first trial of the Chassepot gun; their troops were regulars thoroughly drilled and disciplined, and the loss on the other side was heavy and crushing. Garibaldi had undisciplined, poorly armed recruits; infantry only. With the conquering army in front, they crossed the Italian frontier, to find the Italian army in the rear, which overwhelmed them, seized their arms, and took many of them prisoners; among them Garibaldi, who was arrested at Correse on his journey to Caprera, and imprisoned in the fortress of Varignano, near Spezzia, an island of Greece; and the Italian troops retired from the papal states. Garibaldi, protesting against this treatment, claiming the protection due to an American citizen and an Italian deputy, was set at liberty on the 26th. To commemorate this victory a medal was struck by order of the pope, in the shape of a cross, made of silver, and presented to all who took part in the battle. It bore the inscription, *Fidei et Virtuti*, and *Hinc Victoria*. A monument to the Garibaldians who fell at this battle was dedicated Nov. 25, 1877.

MEN'TCHIKOF, MENTSCHIKOFF, or MENZIKOFF. See MENCHIKOW or MENCHIKOFF, *ante*.

MENTONE (FR. *Menton*), a t. in the department of Alpes Maritimes, France. It is pleasantly situated on the shore of the Mediterranean, and from its southern exposure, as well as a high sheltering range of mountains on the n., it enjoys a salubrious and agreeable climate. In its environs are groves of orange, lemon, and olive trees. Latterly Mentone has become a favorite winter resort of invalids and health loungers from England, Germany, and other countries; and is greatly improved as a place of residence by the addition of numerous hotels, pensions, etc. In 1860, by a vote of the inhabitants, Mentone was detached from the small principality of Monaco, and annexed to France; the French government paying 4,000,000 of francs to the prince of Monaco for relinquishing his rights, and according to him certain privileges. Mentone is within a mile and a half of the Italian frontier on the railway and Corniche road from Nice to Genoa. Pop. '76, 6,891.

MENTONE (*ante*) is celebrated for its bone caves, which are situated upon the e. bay. They are about 90 ft. above the Mediterranean, formed by rifts in the Roches Rouges mountain, and have furnished interesting pre-historic fossils and implements. In the spring of 1872 a fossil human skeleton was found in one of these caves, buried 21½ ft. beneath the surface. The skull is said to have had shells upon it, as if the head had been ornamented with them, and the teeth of the stag, these articles being "perforated and forming a net-work about the head." How the net-work was retained in position it is impossible to say with certainty. The cranium was fractured before and behind, so that no perfect measurement could be made. It belongs to the long-headed, or dolichocephalic, branch of the human family, and is said to have a facial angle of 85°. The height of the figure is estimated to have been 6 feet.

MENTOR, a village and township of Lake co., Ohio; 23 m. n.e. of Cleveland on the Lake Shore railroad; the township extends to the shore of lake Erie; pop. '70, 1666. There are two churches and a graded school. The people are almost all engaged in agriculture and country trade. This little town is noted as having been for some years the residence of gen. James A. Garfield, elected in 1880 president of the United States.

MENTOR, the son of Alcimus, was the trusted friend of Ulysses, who, on setting out for Troy, left to him the charge of his household, and by him Telemachus was educated. His name became a sort of appellative for an instructor and guide of the young.

MENTZ. See MAINZ, *ante*.

MENU. See MANU.

MENU'RA. See LYRE-BIRD.

MENZA'LEH, LAKE, a lake of Egypt, extends e. from the Damietta branch of the Nile, and is separated from the Mediterranean by a narrow strip of land, through which,

however, there are several openings. It receives the Pelusiac and Tanitic branches of the Nile, and is 37 m. in length, by about 16 m. in average breadth. Its surface is studded with islands, the most interesting of which is Tennees, the ancient Tennesus, with Roman remains of baths, tombs, etc. An extensive fishery is carried on on the lake; and its shores abound in wild-fowl. The line of the Suez canal passes through the eastern portion of lake Menzaleh.

MENZEL, WOLFGANG, an eminent German author, was the son of a medical practitioner, and was born at Waldenburg, in Silesia, June 21, 1798. He studied at Jena and Bonn, was for two years schoolmaster at Aargau in Switzerland, and in 1824 returned to Germany. He first made himself known in the literary world by his *Streckverse* (Heidelb. 1823), a volume replete with poetry and wit, and opening up many novel and ingenious views of art and literature. He then engaged with several coadjutors in a periodical called *Europäische Blätter* (Zür. 1824–25), in which war was waged against the prevalent heartlessness and formality of German literature, in which he was led to attack vehemently the school of Goethe. This involved him, however, in a controversy with the extreme admirers of that poet. He was afterward engaged in a succession of controversies, in consequence of opinions expressed by him in his various publications; among which may be noticed his *Geschichte der Deutschen* (3 vols. Zür. 1824–25, and several editions); *Die deutsche Literatur* (2 vols. Stuttg. 1828, and several editions); *Taschenbuch der neuesten Geschichte* (5 vols. Stuttg. 1829–33); *Mythologische Forschungen und Sammlungen* (1842, etc.); and *Geschichte Europas von* 1789–1815 (1853). As a poet, he acquired a high reputation by a volume entitled *Rübezahl* (1829), and another entitled *Narcissus* (1830). His *Gesänge der Völker* (1851) is a valuable lyrical collection. After the July revolution, he set himself to counteract the French influence that set in strongly among the youth of Germany, whence Börne gave him the nickname of *der Franzosenfresser* ("the Frenchman-eater"). He also published *Preussen und Oesterreich im Jahre* 1866, in 1866; *Rom's Unrecht* in 1871; a history of the war of 1870–71; etc. He died in 1873.

MEPHISTOPH'ELES, one of the seven chief devils in the old demonology; the second of the fallen archangels, and the most powerful of the infernal legions after Satan. He figures in the old legend of Dr. Faustus as the familiar spirit of that renowned magician, and his name was commonly used as a term of jocular reproach. To modern readers he is chiefly known as the cold, scoffing, relentless fiend of Goethe's *Faust*, and the attendant demon in Marlowe's *Faustus*.

MEP'PEL, an important trading and manufacturing t. in the Netherlands province of Drenthe, is situated near the northern boundary of Overyssel. Pop. '76, 7,901. It has a trade in butter, cattle, rye, and buckwheat. In 1875 the butter brought to market weighed 3,705,779 lbs. The principal manufactures are spinning flax, weaving linens, sail-cloth, and coarse striped woolen fabrics. There are also corn, saw, and oil mills, breweries, etc. The union of several important water-ways with the Meppeller Diep, through which they flow into the Zuyder Zee, brings a large shipping-trade to the town. Peat is manufactured extensively in the moss-land of Overyssel, the greatest part of which is forwarded from Meppel to Amsterdam and other cities of the Netherlands. Butter, cattle, and bark are sent to England and Germany. Meppel is about nine centuries old, and has often suffered the evils of war, being favorably situated for receiving a garrison.

MEQUINEZ. See MIKNAS.

MERCADANTE, SAVERIO, 1797–1870; b. Altamura. He studied the violin and the flute under Zingarelli at the conservatorio San Sebastiano at Naples, but soon turned his attention to compositions for the voice, at the earnest solicitation of his master. In 1818 he produced a grand cantata, entitled *L'Unione delle Belli Arti*, which was performed at the Teatro Fondo, and met with a very favorable reception. This led to an engagement at the Teatro San Carlo, where his first opera, *L'Apoteosi d'Ercole*, was well received. After this he composed a great number of operas; but many of them were not successful. In 1833 he was appointed chapel master at the cathedral of Novara. In 1836 his opera, *I Briganti*, was performed in Paris, but proved a complete failure, in spite of the extraordinary cast of Rubini, Tamburino, Lablache, and Grisi. He was made director of the royal conservatory at Naples in 1840, but became totally blind in 1862. Though his compositions are vivacious and graceful, his opera *Il Giuramento* and some of his sacred pieces are all that have survived him.

MERCANTILE LAW. This is the only branch of municipal law which, from the necessity of the case, is similar, and in many respects identical, in all the civilized and trading countries of the world. In determining the relations of the family, the church, and the state, each nation is guided by its own peculiarities of race, of historical tradition, of climate, and numberless other circumstances, which are almost wholly unaffected by the conditions of society in the neighboring states. But when the arrangements for buying, selling, and transmitting commodities from state to state alone are in question, all men are very much in the same position. The single object of all is that the transaction may be effected in such a manner as to avoid what in every case must be sources of loss to somebody, and by which no one ultimately is a gainer—viz., *disputes and delay*.

At a very early period in the trading history of modern Europe, it was found that the only method by which these objects could be attained was by establishing a common understanding on all the leading points of mercantile, and more particularly of maritime law. This was effected by the establishment of those maritime codes, of which the most famous, though not the earliest, was the *Consolato del Mare*. It is sometimes spoken of as a collection of the maritime laws of Barcelona, but it would seem rather to have been a compilation of the laws and trading customs of various Italian cities—Venice, Pisa, Genoa, and Amalfi, together with those of the cities with which they chiefly traded—Barcelona, Marseilles, and the like. That it was published at Barcelona towards the end of the 13th c., or the beginning of the 14th, in the Catalonian dialect, is no proof that it originated in Spain, and the probability is that it is of Italian origin. As commerce extended itself to the north-western coasts of Europe, similar codes appeared. There was the *Guidon de la Mer*, the *Rôles d'Oléron*, the *Usages de Damme*, and, most important of all, the ordinances of the great Hanseatic league. As the central people of Europe, the French early became distinguished as cultivators of maritime law, and one of the most important contributions that ever was made to it was the famous ordonnance of 1681, which formed part of the ambitious and in many respects successful legislation and codification of Louis XIV. See CODE. All these earlier attempts at general mercantile legislation were founded, as a matter of course, on the Roman civil law, or rather on what that system had borrowed from the laws which regulated the intercourse of the trading communities of Greece, perhaps of Phenicia and Carthage, and which had been reduced to a system by the Rhodians.

From the intimate relation which subsisted between Scotland and the continent of Europe, the lawyers of Scotland became early acquainted with the commercial arrangements of the continental states; and to this cause is to be ascribed the fact that down to the period when the affairs of Scotland were thrown into confusion by the rebellions of 1715 and 1745, mercantile law was cultivated in Scotland with much care and success. The work of lord Stair, the greatest of all the legal writers of Scotland, is particularly valuable in this department.

In England the case was very different. After the loss of her French provinces the legal system of England became wholly insular, and there was no branch in which it suffered more in consequence of being thus cut off from the general stream of European progress than the law-merchant. It was lord Mansfield who, whether guided by the wider traditions of his original country, or deriving his views from the source from which these traditions sprung, viz., the Roman law, as modified and developed by continental jurisprudence, introduced those doctrines of modern commercial law which English lawyers have since developed with so much acuteness and logical consistency. Many attempts have recently been made to assimilate the commercial laws of England and Scotland, and a commission of lawyers of both countries was recently appointed for the purpose. One of the most important results of their deliberations was the mercantile law amendment act, 19 and 20 Vict. c. 60.

MERCAP'TAN and MERCAPTANS, a class of compounds discovered by Zeise in 1833. The name is a contraction of *mercurio corpus aptum*, given on account of its powerful reactions with compounds of mercury. Zeise's original mercaptan is ethyl hydrosulphide, C_2H_5SH. It is the sulphur analogue of ethyl alcohol, and is produced by the action of hydrosulphide of potassium on ethyl sulphate of calcium. A solution of caustic potash of sp. gr. 1.3 is saturated with sulphureted hydrogen gas and mixed in a retort with an equal volume of solution of ethyl sulphate of calcium of the same density. The retort is connected with a condenser and heated by a bath of salt and water. Mercaptan and water are distilled together, and may be separated by decantation or by a tap funnel, the sp. gr. of mercaptan being 0.8325 at 69.8° F. and only slightly soluble in water. It boils at 96.8° F. giving off a vapor having an intolerable odor of onions, which adheres to the clothing with great obstinacy. It is very inflammable, giving a blue flame. In contact with red oxide of mercury, even in the cold, mercaptan causes a violent reaction with the formation of water and a white substance soluble in alcohol, and separating from the solution in crystals having the formula $Hg(SC_2H_5)_2$.

MERCATOR, GERARD, 1512–94; b. Flanders; the name is a Latinized form of his real name, Kauffman, i.e., merchant. Having finished his elementary education at Bois-le-Duc he studied and took a degree in philosophy at the university of Louvain. After leaving the university, he made a profound study of the sciences of geography and mathematics, and in 1559 was appointed cosmographer to the duke of Juliers. His name is perpetuated by the projection used in nautical maps, in which the meridians are represented by parallel lines, and parallels of latitude by straight lines intersecting the meridians at right angles. The projection, however, seems to have been applied to nautical maps by Edward Wright. Besides a large number of maps, Mercator compiled a chronological table under the name of *Chronologia a Mundi Exordio ad annum* 1556; and a series of geographical tables, *Tabulæ Geographicæ ad Mentem Ptolemaei Restitutæ*. He also wrote two theological treatises, one a *Harmony of the Gospels*, and the other, which was condemned by the church, a work on the *Creation of the World*.

MERCATOR'S PROJECTION, or MERCATOR'S CHART. See MAP.

MERCED', a co. in California, extending n.e. from the main coast range, traversed by the San Joaquin river, and by the Visalia division of the Central Pacific railroad; 1680 sq.m.; pop. 2,807. Cattle, wheat, wool, and fruit are the chief products; brandy and wine are the principal manufactures. Capital, Snelling.

MERCER, a co. in n.w. part of Dakota, adjoining Missouri on the n. and e.; 9,000 sq.m.; pop. not enumerated in 1870; in 1880 the census states that it is combined with Billings, Morton, and Stark cos.; total pop., 1563. It is drained by the Big Knife and other branches of the Missouri river. The surface is rolling and capable of cultivation, but at present the locality is sparsely settled and there is little trade or agriculture.

MERCER, a co. of n.w. Illinois, bounded w. by the Mississippi river, and traversed by the Chicago, Burlington, and Quincy, and the Rockford, Rock Island and St. Louis railroads; 540 sq.m.; pop. '80, 19,505. The surface is rolling, the soil fertile. Live stock, grain, and wool are the principal products. Coal is mined in various places. Carriages and wagons are the chief articles of manufacture. Capital, Aledo.

MERCER, a co. in the blue-grass region of Kentucky, near the center of the state, and bounded n.e. by the Ohio river; 308 sq.m.; pop. '80, 14,141. Live stock, wheat, corn, and wool are the chief productions. Capital, Harrodsburg.

MERCER, a co. of Missouri, bounded n. by Iowa, and traversed by the south-west division of the Chicago, Rock Island and Pacific railroad; 480 sq.m.; pop. '80, 14,674. It is well timbered, with a fertile soil, containing deposits of iron, copper, and coal. Cattle, grain, and wool are among the chief products. Capital, Princeton.

MERCER, a co. of New Jersey, bounded s.w. by the Delaware river, and traversed by the Camden and Amboy, the New Jersey, the Belvidere, Delaware, and other railroads; about 220 sq.m.; pop. '80, 58,058. The surface is generally level, the soil very fertile and well cultivated. The principal productions are live stock, wool, grain, tobacco, hay, fruit, and garden products. The manufacturing interests include iron, iron castings, stone, earthen and metallic wares, carriages, clothing, woolen goods, flour, etc. Capital, Trenton.

MERCER, a co in Ohio, bounded on the w. by Indiana; 470 sq.m; pop. '80, 21,808. The great canal reservoir, probably the largest artificial lake in the world, is nearly all in this county. It is 8 m. in length, 3½ in width, and 10 ft. deep, and covers an area of 17,000 acres. Its waters feed the Miami canal. The chief productions of the county are cattle, grain, and wool. Coal is mined to a considerable extent, and bricks and timber are extensively manufactured. Capital, Celina.

MERCER, a co. of Pennsylvania, bounded w. by Ohio, and traversed by the Altantic and Great Western, the Erie and Pittsburg, the Jamestown and Franklin, and the Shenango and Allegheny railroads; 600 sq.m.; pop. 49,977. The surface is uneven, the soil very fertile. Coal is abundant; chief productions, live stock, grain, and wool. There are manufactures of leather, lumber, flour, carriages, iron, and iron castings. Capital, Mercer.

MERCER, a co. of West Virginia, bounded s. by Virginia, and lying between Great Flat-top mountain on the n.w., and East River mountain on the s.e; 450 sq.m.; pop. '80, 7,467. It is a well-timbered region, with a fertile soil, containing deposits of coal and limestone. Capital, Princeton.

MERCER, CHARLES FENTON, LL.D., 1778–1858; b. Fredericksburg, Va.; graduated at Princeton in 1797; in 1798, in anticipation of a war with France, he was commissioned by Washington as capt. of cavalry; studied law, and in 1802–3 traveled in Europe, was aid-de-camp to the governor of Virginia during the war of 1812; commanded the defenses of Norfolk in 1813, with the the rank of brig.gen.; was a member of the legislature from 1810 to 1817, and chairman of the committee of finance in 1816, when he introduced the bill to incorporate the Chesapeake and Ohio canal company; was elected to congress as a federalist in 1816, and remained a member of that body until 1840. In 1853 he visited Europe, and conferred with leading men of different countries in regard to measures for the complete abolition of the foreign slave-trade. He was a leading advocate of the protection of home manufactures. Died at Howard, near Alexandria.

MERCER, HUGH, 1721-77; b. in Aberdeen, Scotland; educated at the university there; entered the medical profession, and served as assistant-surgeon in the army of prince Charles Edward, the "young pretender," in 1743. The insurrection proving a failure, he emigrated to America in 1747, settling as a physician near the present town of Mercersburg, Penn. He served as a volunteer in Braddock's campaign, was appointed capt., and so severely wounded in the battle on the Monongahela that he was unable to keep up with the other fugitives from that disastrous field, wandered for several weeks alone in the forest, until at last he reached fort Cumberland, 100 m. from the point of departure. For his courage in this expedition he received a medal from the city of Philadelphia. In 1758 he was promoted to the rank of lieut.col., accompanied gen. Forbes to fort Duquesne, now Pittsburg, and commanded the post for some time. After this he settled as a physician in Fredericksburg, Va., but entered zealously into the revolutionary conflict. He organized and drilled the minute-men of Virginia in 1775, and

the militia in 1776, and at Washington's request was chosen a brig.gen. by congress June 5, 1776. He commanded a column in the attack on Trenton, and led the advance in the night march on Princeton, which he had himself advised. Early in the battle there he was mortally wounded and left for dead on the field. Being discovered alive, he was taken to a neighboring farm-house, where he expired in the arms of maj. Lewis, his aid-de-camp. His funeral in Philadelphia is said to have been attended by 30,000 people, and a monument to his memory was erected at Laurel Hill cemetery in 1840. His son, HUGH, was educated at the expense of the nation.

MERCER, JESSE, 1769–1841; b. Halifax co., N. C. After removing to Georgia he was ordained to the ministry in the Baptist denomination, and became pastor of a church in Wilkes co. in 1789. He was a popular and useful preacher. He took a prominent part in the constitutional convention in 1798. He founded an institution named Mercer university, which at first was at Pennfield, but was removed to Macon, Ga., and is prosperous. He published a collection of hymns entitled *Mercer's Cluster*, generally used in the southern Baptist churches; *History of the Georgia Baptist Association;* and edited for several years the *Christian Index* of Georgia.

MERCER, JOHN FRANCIS, 1758–1821; b. Va.; educated at William and Mary college; served in the continental congress 1782–85, and was a delegate from Maryland to the convention which formed the federal constitution, which he refused to sign. He was a member of congress from Maryland 1792–94, and governor of that state 1801–3. He also served in the state legislature.

MERCERSBURG, a borough in Franklin co., Penn., at the terminus of a branch of the Cumberland Valley railroad, 15 m. s.w. from Chambersburg, and 62 m. s.w. from Harrisburg. The theological seminary of the German Reformed church, commenced at Carlisle, Penn., in 1825 and removed to York four years later, was, in 1835, located at Mercersburg, where it continued until its removal in 1871 to Lancaster. The high school, commenced by the same denomination at York in 1830, was removed to Mercersburg in 1835; and having, under a charter from the state, become Marshall college, remained there until 1853, when it was removed to Lancaster and combined with Franklin college under the name of Franklin and Marshall college. Mercersburg college was organized 1865, under the care of the German Reformed church, and the theological department was added in 1872.

MERCERSBURG THEOLOGY is the name given to a philosophical representation of Christian doctrine emanating from the theological seminary of the German Reformed church formerly located at Mercersburg, Penn., and especially from Dr. John W. Nevin, one of the professors there. Critical students of theology regard it as presenting substantially Schleiermacher's views modified by American habits of thought and by faith in the inspiration of the Scriptures. It has its starting point in a peculiar psychological theory concerning the person of Christ and the nature of man. This theory determines the views expressed—

I. *Concerning the person of Christ.* Dr. Nevin says that he had not one life of the body and another of the soul; nor one life of his humanity and another of his divinity. It is one life throughout, and it is in all respects a true human life. Christ is the archetypal man in whom the true idea of humanity is brought to view. He is the ideal man in whom only human nature is complete. The writers of the *Mercersburg Review* teach that the incarnation is the proper completion of humanity and that the glorification of Christ was the full advancement of our human nature itself to the power of a divine life.

II. *Concerning human nature.* "The world in its lower view is not simply the outward theater or stage on which man is set to act his part as a candidate for heaven. In the widest of its different forms of existence it is pervaded throughout with the power of a single life, which comes ultimately to its full sense and force only in the human person." The world is an organic whole which completes itself in man; and humanity is regarded throughout as a single grand fact which is brought to pass not at once, but in the way of history, unfolding always more its true interior sense, and reaching on to its final consummation. It is a universal property of life to unfold itself from within, by a self-organizing power, towards a certain end, which end is its own realization, or, in other words, the actual exhibition and actualization in outward form of all the elements, functions, powers, and capacities which potentially it includes. Thus life may be said to be all at its commencement which it can become in the end. Humanity is defined to be a generic life. Man is the manifestation of this generic life in connection with a special corporeal organization, by which it is individualized and becomes personal. It was this generic humanity which sinned in Adam, and thenceforth was corrupt in all the individual men in whom it was manifested. It was this generic humanity which Christ assumed into personal union with his divinity, not as two distinct substances, but so united as to become one generic human life. This purified humanity now develops itself by an inward force in the church, just as from Adam generic humanity was developed in his posterity. It is still, however, assumed as the fundamental idea of the gospel that God and man in Christ are one. This generic humanity is only a form of the life of God. And as to its sinning in Adam, and being thenceforth corrupt, sin and corruption are only imperfect development. God, the universal life principle, as Dr. Nevin calls it, so variously manifested in the different existences of this world, is imperfectly or insuf-

ficiently manifested in man generally, but perfectly in Christ, and through him ultimately in like perfection in his people.

III. *Concerning justification.* Dr. Nevin says: "Our nature reaches after a true and real union with the nature of God as the necessary complement and consummation of its own life. The idea which it embodies can never be fully actualized under any other form. The incarnation is the proper completion of humanity. Christ is the true ideal man. The word became flesh—not a single man only as one among many, but 'flesh' or humanity in its universal conception. How else could he be the principle of a general life, the origin of a new order of existence for the human world as such? How else could the value of his mediatorial work be made over to us in a real way, by a true imputation, and not a legal fiction only?" "Christianity is a life, not only as revealed at first in Christ, but as continued also in the church. It flows over from Christ to his people, always in this form. They do not simply bear his name and acknowledge his doctrine. They are so united to him as to have part in the substance of his life itself." "By the hypostatical union of the two natures in the person of Jesus Christ, our humanity as fallen in Adam was exalted again to a new and imperishable divine life." "The object of the incarnation was to couple the human nature in real union with the logos as a permanent source of life." "The new life of which Christ is the source and organic principle is in all respects a true human life;" "not a new humanity, wholly dissevered from that of Adam, but the humanity of Adam itself, only raised to a higher character, and filled with new meaning and power, by its union with the divine nature." "Christ's life, as now described, rests not in his separate person, but passes over to his people." He communicates his own life substantially to the soul on which he acts, causing it to grow into his very nature. "This is the mystical union, the basis of our whole salvation; the only medium by which it is possible for us to have an interest in the grace of Christ under any other view." With his substance, his life, his divine human nature, thus communicated to the soul, come his merit, his holiness, his power, his glory. These are predicates of the nature which becomes ours, constituting our personal life and character. Even the resurrection is to be effected, not by the power of Christ operating *ab extra,* as when he raised Lazarus from the dead, but by a new divine element.

"The fall of Adam was the fall of the race; not simply because he represented the race, but because the race was comprehended in his person. Sin in him was sin incorporated with the inmost life of humanity, and became from this point onward an insurmountable law in the progress of its development." It was "an organic ruin, the ruin of our nature; not simply because all men are sinners, but as making all men to be sinners. The human race is not a sand heap; it is the power of a single life. Adam's sin is therefore our sin. It is imputed to us, indeed, but only because it is ours. A fallen *life* in the first place, and on the ground of this only, imputed guilt and condemnation. In order then that the race might be saved, it was necessary that a work should be wrought not beyond it, but in it. Our nature, humanity, must be healed, the power of sin, incorporated in that nature, must be destroyed. For this purpose the logos, the divine word, took our humanity into personal union with himself. As the bearer of a *fallen* humanity he must descend with it to the lowest depths of sorrow and pain. He triumphed over the evil; his passion was the world's spiritual crisis in which the principle of health came to its last struggle with the principle of disease and gained the victory. This was the atonement. When Christ died and rose, humanity died and rose in his person. Our nature was thus restored and elevated, and by receiving this renovated nature we are saved. Christ's merits are inseparable from his nature; they cannot be imputed to us, except so far as they are immanent in us. As in the case of Adam, we have his nature, and therefore his sin; so we have the nature of Christ, and therefore his righteousness. The nature we receive from Christ is a theanthropic nature. For as he is one person, his life is one. His divine nature is at the same time *human,* in the fullest sense. All that is included in him as a person—divinity, soul, and body—is embraced in his life. It is not the life of the logos, separately taken, but the life of the word made flesh, the divinity joined in personal union with our humanity, which is thus exalted to an imperishable divine life. It is a divine human life.

IV. *Concerning the church.* This being so, "the divine human nature as it exists in the person of Christ passes over to his people, thus constituting the church which is his body, the fullness of him that filleth all in all. The process is not mechanical, but organic. It takes place in the way of history, growth, regular living development." The supernatural becomes natural, and as thus made permanent and historical in the church, must, in the nature of the case, correspond with the form of the supernatural as it appeared in Christ himself. The church must have a true theanthropic character throughout. The union of the divine and human in her constitution must be inward and real, a continuous revelation of God in the flesh, exalting this last continuously into the sphere of the Spirit. The incarnation being thus progressive in the way of actual human development in the church, the church is, in very deed, the depository and continuation of the Savior's theanthropic life itself, in which powers and resources are continually at hand, involving a real intercommunion and interpenetration of the human and divine.

V. *Concerning the sacraments.* A part, at least, of these powers and resources is

lodged in the sacraments of the church, which have a real objective force contained in themselves. Our faith is needed only to make room for that force in our souls. The things signified are bound to the signs by the force of a divine appointment; so that the grace goes inseparably along with the signs, and is truly present for all who are prepared to make it their own. And while union with Christ is by regeneration, regeneration is by the church. It is by the ministrations of this living church, in which the incarnation of Christ is progressive, and by her grace-bearing sacraments that the theanthropic life of Christ is continually carried over to new individuals. The sacraments, therefore, convey and sustain the life of Christ—his divine human life. We partake not of his divinity only, but also of his true and proper humanity; not of his humanity in a separate form, nor of his flesh and blood alone, but of his whole life, as an undivided form of existence. Consequently in the Lord's supper he is present in a peculiar way, as to his entire theanthropic life; the sign and the thing signified, the visible and invisible, form one invisible presence. Unbelievers receive only the outward sign, because they have not the organ of reception for the inward grace. Yet the inward grace is there, and believers receive both—the outward sign and the one undivided theanthropic life of Christ. This gives the eucharist a peculiar and altogether extraordinary power, as providing a mode of receiving Christ to be had nowhere else. Where the way is open for it to take effect, the sacrament serves in itself to convey the life of Christ into the person of a believer.

MERCHANT COMMISSION. See COMMISSION MERCHANT; FACTOR, *ante*.

MERCHANT SHIPPING ACT of 1854 (stat. 17 and 18 Vict. c. 104), a measure which in many important respects amended, and at the same time consolidated, the law of this country relative to merchant shipping. By the merchant shipping repeal act of the same year (stat. 17 and 18 Vict. c. 120), the statutes relative to merchant shipping previously in force were, with one or two unimportant exceptions, repealed; the new act, which formed an almost complete code of the laws affecting merchant-ships, coming in their place. No fewer than nine acts have since been passed, some amending, others supplementing, the act of 1854—viz., the merchant shipping act amendment acts, 1855 and 1862 (18 and 19 Vict. c. 91, and 25 and 26 Vict. c. 93); the merchant shipping act, 1867 (30 and 31 Vict. c. 124); the colonial shipping act, 1868 (31 and 32 Vict. c. 129); the merchant shipping (colonial) act, 1869 (32 and 33 Vict. c. 11); the merchant shipping act, 1871 (34 and 35 Vict. c. 110); the merchant shipping act, 1872 (35 and 36 Vict. c. 73); the merchant shipping act, 1873 (36 and 37 Vict. c. 85); the merchant shipping act, 1875 (38 and 39 Vict. c. 88). A bill to consolidate and amend the law relating to merchant shipping has been brought before the house of commons, but has not been proceeded with. The act of 1854 is divided into 11 parts; and the principal provisions of the amendment acts are referred to the part of the principal act to which they severally belong, so as to facilitate the reading the acts conjointly. The act of 1867, with the exception of two unimportant clauses, is occupied with a single subject—the enforcement of proper sanitary conditions on board ships. The acts of 1868 and 1869, relating to colonial shipping, are not of general importance.

The general superintendence of matters relating to merchant ships and seamen is, by the act of 1854, part I., intrusted to the board of trade, which is invested with powers for compelling local bodies, and shipowners or shipmasters, to perform the duties which the shipping acts impose upon them.

British ships, their ownership, measurement, and registry, is the subject of part II. of the act of 1854. And it is provided that no ship shall be deemed a British ship unless she belong wholly to owners who are of one of the following descriptions: 1. Natural-born subjects; 2. Persons made denizens, or persons naturalized in terms of an act of parliament, or an act of the legislative authority of some British possession; 3. Bodies corporate established under, subject to the laws of, and having their principal place of business in the United Kingdom or some British possession. Every British ship, with a few unimportant exceptions, must be registered; and a ship, unless registered, though subject to all the ordinary liabilities, is not to be recognized as a British ship. The registration is to be made by the principal officer of customs for the time being at any port or place in the United Kingdom approved by the board of trade for the registry of ships, and by certain specified officers in the colonies and possessions abroad. The registration is to comprise the name of the ship, which cannot afterwards be changed without permission of the board of trade, and the names and descriptions of the owners; also the tonnage, as ascertained by specified rules, the build, and description of the vessel, the particulars of her origin, and the name of the master. A certificate of registry, containing all the particulars registered, is given by the registrar to the master. On this certificate, changes in the ownership and changes of the master are indorsed as they occur; and a new certificate may be granted, after certain formalities, in exchange for a former one, or in the event of a former certificate being lost. The master is the person entitled to the custody of this document, and it is a penal offense to detain it from him, upon whatever pretense of right or title. The certificate is given up to the registrar on the ship being lost, or ceasing to be British. The acts of 1871, 1873, and 1875 require certain particulars to be marked on ships in specified ways—viz., the name, the official number, the registered tonnage, a scale denoting the draught of water, the deck-line, and the load-line; and besides

that there are penalties for defacing, or not maintaining such marks, and for making them inaccurately, the ship may be detained until the requirements of the law are complied with. In any case or class of cases, the board of trade may direct that the draught of water, and also the extent of the clear side of a sea-going ship be recorded by the officers of customs, and the record preserved, and also marked in the official log-book. The act of 1873 provides that where a British ship has ceased, for any reason other than capture or transference to a foreign owner, to be registered, she shall not be again put upon the register without a survey to test whether she is seaworthy.

The property in every ship is, for purposes of registration, divided into sixty-four shares. No person is entitled to be registered as owner of any fractional part of a share; but any number of persons not exceeding five may be registered as joint-owners of a share. Counting joint-owners, who are not entitled to dispose in severalty of their respective interests, as constituting one person only, not more than thirty-two persons can be registered at the same time as owners of a ship. The power of disposing of the ship or its shares is vested exclusively in registered owners. Notwithstanding this, persons beneficially or equitably interested are to have their interests protected upon application to the proper court. When a registered ship, or any share therein, is disposed of to persons qualified to be owners of British ships, the transfer must be made by a bill of sale under seal, according to a form prescribed, and the names of the transferees are to be entered on the register as owners of the ship or share. Mortgages also must be in a form prescribed, and are to be recorded by the registrar upon production to him in each case of the mortgage deed.

In part III., under the heading "masters and seamen," it is provided that local marine boards shall be established at certain ports of the United Kingdom; and that each of these shall consist of 2 *ex officio* members—the mayor or provost, and the stipendiary magistrate of the place—4 members appointed by the board of trade, and 6 elected annually by the owners of foreign-going ships and of home-trade passenger-ships. The local marine board is required to establish an office (called the shipping office in the act of 1854, but now, under the act of 1862, called the mercantile marine office) or offices, under the management of a superintendent (originally called shipping-master), whose duty it is to afford facilities for engaging seamen, by keeping registries of their names and character; to superintend and facilitate their engagement and discharge; to provide means for securing the presence on board at the proper time of men who are so engaged; to facilitate the making of apprentice-ships to the sea-service; and to perform such other duties relating to merchant-seamen and merchant-ships as shall be committed to them by the board of trade. The local marine boards are also required to hold examinations for persons who intend to become masters or mates of foreign-going ships or home-trade passenger-ships. And no person can be employed in a foreign-going ship as master, or first, or second, or only mate, or in a home-trade passenger-ship as master, or first or only mate, unless he holds a certificate of competency obtained at such an examination; or else a certificate of service obtained in virtue of his having held a certain rank in the royal navy, or certain employment in the merchant service previous to the passing of the act of 1854, as specified in the act. The act of 1862 extended the requirement of a certificate from the board of trade to engineers employed in steamships. There are first and second class engineers' certificates, and an engineer cannot be employed unless he holds the one or the other—according to his employment and the engine-power of the ship—obtained at an examination, or else in consideration of his service previous to 1862, or of the rank he has held in the royal navy.

The master of every ship, excepting ships of less than 80 tons burden, exclusively employed in the coasting-trade, is required to enter into an agreement—in a form prescribed by the board of trade—with every seaman whom he takes to sea from any part of the United Kingdom. This document, which must be signed by the master and by the seamen, sets forth the nature and duration of the voyage; the number and description of the crew; the time at which each seaman is to be on board, or to begin work; the capacity in which he is to serve; the amount of his wages; a scale of provisions; regulations as to conduct; and such punishments for misconduct as the board of trade shall have sanctioned, and as the parties shall have agreed to adopt. In the case of foreign-going ships, the agreement must be made before, and be attested by the superintendent of the mercantile marine office; and seamen engaged abroad must be engaged, if at a colonial port, in the presence of a shipping-master or customs officer; if at a foreign port, in the presence of the consul. The discharge of the crews of foreign-going ships must be made at the mercantile marine office before the superintendent, to whom the ship-master must deliver a full account of the wages due to each seaman, and of all deductions made from them. It is enacted that no right to wages shall be dependent on the earning of freight; and that every stipulation on the part of the seaman for abandoning his right to wages in the event of the loss of the ship, shall be inoperative. Previous to 1872, time agreements with seamen in home-trade ships could not be made for a longer period than 6 months. This provision was repealed by the act of that year. The act of 1873 provided that in an agreement with seamen, it should only be necessary to state the maximum period which the agreement is to cover, and the places or parts of the world, if any, to which the voyage is not to extend. Some provision was made in the act of 1854 as to the amount of space to be set apart for the accommodation of every seaman,

as to the maintenance of the sleeping-places in a proper state of order and ventilation, and as to the supply of medicines for the voyage; but the clauses of that act relating to these subjects have been repealed, and fuller provision for them has been made by the act of 1867. In this act, special precautions have been taken to insure that ships take to sea with them a sufficient supply of lime-juice and other anti-scorbutics; and the local marine boards are empowered to appoint medical inspectors to examine seamen applying for employment, if the ship-master desires it.

The act of 1854 provided for the establishment in the port of London of a general register and record office for seamen, under the management of a registrar-general of seamen; and required returns to be made to this official by the officers of customs, and through superintendents of mercantile marine offices, by masters of ships both in the home and in the foreign trade, from which a general view might be had as to the state of our mercantile marine. Official log-books, in forms prescribed, are required to be kept in every ship, other than those exclusively employed in the coasting-trade, either in connection with or distinct from the ordinary log-book; and in these, entries must be made of numerous specified occurrences. Provision is made for the punishment of offenses against discipline and good-conduct committed either by seamen or by ship-masters, and for the trial in this country of persons charged with any crime committed upon the high seas. The act of 1871 provides that where seamen are charged with deserting or refusing to join a ship, or refusing to go to sea, and a fourth of the crew, or 5 or more of the crew, if the number of the crew is 20, allege that the ship is from any cause, as unseaworthiness, overloading, improper loading, or defective equipment, not in a fit condition to proceed to sea, or that the accommodation of the ship is insufficient, the court before which they are charged may order the ship to be surveyed, and unless the opinions of the surveyor be disproved, shall act upon them; the ship-owner or the accused paying the cost of the survey, according as the defense is sustained or overruled. Where the defense is sustained, the court may, under the act of 1873, make an order for compensation to be paid by the ship-owner or ship-master to the seamen. The board of trade may suspend or cancel the certificate (whether of competency or of service) of any master or mate (1) if, after investigation, he is reported to be incompetent, or to have been guilty of any gross act of misconduct, drunkenness, or tyranny; (2) if, after investigation, it is reported that the loss or abandonment of, or serious damage to any ship, or loss of life, has been caused by his wrongful act or default; (3) if he is superseded by the order of any admiralty court, or naval court held abroad under the provisions of the act; or (4) if he is shown to have been convicted of any offense.

In Part IV., under the head of "Safety and Prevention of Accidents," rules are laid down as to the boats and life-buoys which are to be carried by sea-going ships; and it is provided that the officers of customs shall not grant a clearance to any vessel by which those rules have not been complied with. As to the use of lights and fog-signals on board ships at sea, the regulations now in force are contained in the schedules of the act of 1862; where is also laid down the rule of the road for preventing collisions between ships meeting each other at sea. Under the acts of 1871 and 1873, ships which come into collision are required to exchange names, and give other information necessary for identification; and if, after the collision, one of the vessels does not stay by and give assistance to the other, it is deemed to have been in the wrong. The person in charge of it may be prosecuted for a misdemeanor, and have his certificate canceled. Wherever one of two vessels which have been in collision has infringed the regulations of the shipping acts, it is to be deemed in the wrong unless circumstances are adduced which disprove this presumption. Certain stringent provisions are made as to the build and equipment, and also as to the surveying and certificating of steamships. The act of 1872, which transfers to the board of trade the powers exercised under the passenger acts by the emigration commissioners, and, in certain cases, by the home secretary, requires that passenger steamers should undergo survey at least once a year. Under the acts of 1871, 1873, and 1875, the board of trade is enabled, either on the information of complainants, or of its own motion, to order any vessel to be surveyed, and after survey to declare it unseaworthy, and to make an order for its detention, or for its release, only on the fulfillment of such conditions as the board may prescribe. The owner or master of the vessel must be furnished with a copy of the surveyor's report on which the order of the board of trade has proceeded, and he may appeal to the local court having admiralty jurisdiction, the decision of which is final. The owner of a vessel detained pays the cost of the survey, and the complainant whose case has not been substantiated pays the cost of the survey, and is liable in compensation to the owner of the vessel; the board of trade also is liable in compensation to the owner when it has acted of its own motion, and unseaworthiness has not been established. The act of 1875 also contains the following provision (s. 4): "Every person who sends to sea, or is a party to any attempt to do so, and every master who knowingly takes to sea, a ship in such unseaworthy state, that the life of any person would be likely to be thereby endangered, shall be guilty of a misdemeanor. Burden laid on the accused of proving that he did all he could to insure seaworthiness, or the ship going to sea in such unseaworthy state was, in the circumstances, reasonable and justifiable." Any person prosecuted under this provision is enabled to give evidence on his own behalf. The act of 1873 contains provisions as to

the carriage of dangerous goods, and goods suspected of being dangerous; and the act of 1875 provides for the carrying of grain.

For the provisions as to pilotage, in Part V., we refer to the acts themselves. See also PILOT.

Part VI. deals with the subject of light-houses. See LIGHT-HOUSE; TRINITY HOUSE; and NORTHERN LIGHT-HOUSES.

Part VII. relates to the mercantile marine fund.

Part VIII. makes provision for cases of wreck, casualties, and salvage. An inquiry is to be made whenever any ship is lost, abandoned, or materially damaged on or near the coasts of the United Kingdom; or causes loss or material damage to any other ship on or near such coasts; whenever, by reason of any casualty on board of any ship, on or near such coasts, loss of life ensues; and whenever any such loss, abandonment, damage, or casualty happens elsewhere, and any competent witnesses thereof arrive at any place in the United Kingdom. This inquiry is to be made by the inspecting officer of the coast-guard, or the principal officer of customs of the place at which the occurrence in question happened, or of the place at which competent witnesses of it arrive, if it has happened abroad, or can be conveniently examined; or by some other person appointed for the purpose by the board of trade. Such officer or person, if he thinks fit, or if the board of trade so directs, may have the matter formally investigated before two justices or a stipendiary magistrate; and the board of trade may appoint some person of nautical skill and knowledge to act as assessor to such justices or magistrate. If the conduct of any master or mate is in question, the magistrates may require him to deliver up his certificate pending the inquiry; and the certificate may be canceled or suspended by the board of trade upon their report. The board of trade has the general superintendence of all matters relating to wreck, and has power to appoint a receiver of wreck in any district.

Part IX. relates to the liability of ship-owners; and the provisions of the principal act have here been materially altered by the act of 1862. Under the act of 1862, the owners of any ship, whether British or foreign, are not answerable in damages for any loss of life or personal injury to persons carried in the ship; for any damage or loss caused to any goods on board the ship; for any loss of life or personal injury by reason of the improper navigation of the ship caused to any person carried in any other ship; or for any loss or damage similarly caused to any other ship, or the goods on board of it, when such loss, or injury, or damage happens without their actual fault or privity, except as follows: Where loss of life or personal injury has occurred either alone or together with loss or damage to ships and merchandise, they are liable to the extent of £15 for each ton of the ship's tonnage; where there is loss or damage only of ships or merchandise, they are liable to the extent of £8 per ton. The tonnage, on account of which the liability in these cases is to be calculated, is, in the case of sailing-ships, the registered tonnage, and, in the case of steamships, the gross tonnage, without deduction on account of the engine-room; and the tonnage of foreign ships is to be estimated according to the rules of measurement laid down for British ships. The act of 1854, however, provided that the owners of sea-going ships should be liable in respect of every loss of life, personal injury, loss of or damage to goods which may arise on distinct occasions, to the same extent as if no other loss, injury, or damage had arisen; and this provision is still in force. In cases of loss of life or personal injury, the act of 1854 empowers the board of trade to institute an inquiry, and provides in detail for the recovery of damages before the sheriff and a jury. The damages are to be assessed at not more than £30 for each case of death or personal injury. These are to be paid to her majesty's paymaster-general, and to be distributed by him as the board of trade directs; the board having power to direct payment of such compensation, not exceeding the statutory amount, as may be thought fit. A person dissatisfied with the amount of damages awarded to him may bring his action in the ordinary courts, but he is liable in the costs of the action unless he recover a sum exceeding double the statutory amount.

Part X. of the act of 1854 lays down the legal procedure to be taken in cases arising under the act; and part XI. deals with several miscellaneous matters of no general importance. The act of 1862 provided that foreign ships within British jurisdiction shall be subject to the rules for preventing collisions applicable to British ships. The final issue of Mr. Plimsoll's indefatigable labors was the passing of the act to amend the merchant shipping acts, which became law in Aug., 1876. Here provision is made for the detection of unseaworthy ships, to prevent overloading, to secure that all deck cargoes shall be included in the tonnage, and that grain cargoes shall not be carried loose in bulk, but shall be kept from shifting either by boards or bulkheads or by being carried in sacks. The act of 1873 provides for the application, by order in council, of all the provisions of the merchant shipping acts to foreign vessels, the states to which they belong assenting. The act of 1862 contains the law on the subject of delivery of goods and lien for freight (for which see LIEN).

MERCHANTS' MARKS. In the middle ages it was the practice for merchants, traders, and others to whom the proper use of heraldry was not conceded, to be allowed by the heralds to bear devices indicative of their trades or occupations. A cutler might bear

his knife, a tailor his shears, a mason his trowel and compasses. These insignia were in strictness ordered to be borne only in "targets hollow at the chief flankes," yet we often find them on shields, and sometimes even impaled and quartered with arms. Merchants, along with a monogram of their initials, often bore a mark composed of a cross and a figure resembling the Arabic numeral 4 turned backwards—perhaps a symbol of the Holy Trinity, though it has also been explained to represent the mast and yard of a ship. The insignia of their companies were frequently borne by merchants in a chief above their marks, and occasionally quartered with them. These merchants' marks were probably the origin of the trade brands and marks of our own time. Many of them are to be seen sculptured on the walls and roofs of the churches of the 14th c. and 15th c., and engraved on monumental brasses both in England and on the continent. Seals with merchants' marks are occasionally found appended to conveyances of land.

MER'CIA. See HEPTARCHY.

MERCURY. See HERMES.

MERCURY, planet. See SOLAR SYSTEM, *ante*.

MERCURY, or QUICKSILVER (symb. Hg, equiv. 100—new system, 200—sp. gr. 13.6), one of the so-called noble metals, remarkable as being the only metal that is fluid at ordinary temperatures. It is of a silvery white color, with a striking metallic luster. When pure, it runs in small spherical drops over smooth surfaces; but when not perfectly pure, the drops assume an elongated or *tailed* form, and often leave a gray stain on the surface of glass or porcelain. Moreover, the pure metal, when shaken with air, presents no change upon its surface; while, if impure, it becomes covered with a gray film. It is slightly volatile at ordinary temperatures, and at 662° it boils, and forms a colorless vapor of sp. gr. 6.976. Hence it is capable of being distilled; and the fact of its being somewhat volatile at ordinary temperatures, helps to explain its pernicious effects upon those whose trades require them to come much in contact with it—as, for example, the makers of barometers, looking-glasses, etc. At a temperature of −39°, it freezes, when it contracts considerably, and becomes malleable. In consequence of the uniform rate at which it expands when heated, from considerably below 0° to above 300°, it is employed in the construction of the mercurial thermometer.

All mercurial compounds are either volatilized or decomposed by heat; and when heated with carbonate of soda, they yield metallic mercury. Native or virgin quicksilver only occurs in small quantity, usually in cavities of mercurial ores. Of these ores, by far the most important is *cinnabar* (q.v.). There are two means of obtaining the metal from the cinnabar: the ore may be burned in a furnace, in which case the sulphur is given off as sulphurous acid, and the mercury is collected in a condensing chamber; or the ore may be distilled with some substance capable of combining with the sulphur—as, for example, with slaked lime or iron filings.

The mercury imported into this country is usually almost chemically pure. If the presence of other metals is suspected, it may be pressed through leather, re-distilled, and then digested for a few days in dilute cold nitric acid, which exerts little action on the mercury, if more oxidizable metals are present. The mercury, after being freed from the nitric acid by washing with water, is chemically pure.

There are two oxides of mercury, the black suboxide (Hg_2O) and the red oxide (HgO). Both of these lose all their oxygen when heated, and form salts with acids. The *black suboxide*, although a powerful base, is very unstable when isolated, being readily converted by gentle warmth, or even by mere exposure to light, into red oxide and the metal ($Hg_2O = HgO + Hg$). The most important of its salts is the nitrate ($Hg_2O, NO_5 + 2Aq$), from whose watery solution ammonia throws down a black precipitate known in pharmacy as *mercurius solubilis Hahnemanni*, from its discoverer, and consisting essentially of the black suboxide with some ammonia and nitric acid, which are apparently in combination. Of the *red oxide*, the most important salts are the nitrate ($HgO, NO_5 + 8Aq$); the sulphate (HgO, SO_3), which is employed in the manufacture of corrosive sublimate; and the basic sulphate ($3HgO, SO_3$), which is of a yellow color, and is known as *turpeth mineral*.

The haloid salts of mercury correspond in their composition to the oxides. Of the most important of these—the chlorides—there are the subchloride (Hg_2Cl), well known as calomel (q.v.), and the chloride (HgCl), or corrosive sublimate.

The *chloride* (formerly termed the bichloride, when calomel was regarded as the protochloride, and the equivalent of Hg was regarded as 200 instead of 100), when crystallized from a watery solution, occurs in long white glistening prisms; but when obtained by sublimation, it occurs in white transparent heavy masses, which have a crystalline fracture, and chink with a peculiar metallic sound against the sides of the bottle in which they are contained. This salt melts at 509°, and volatilizes unchanged at about 570°. It has an acrid metallic taste. It is soluble in 16 parts of cold, and in less than three parts of boiling water, and dissolves very freely in alcohol and in ether. Corrosive sublimate enters into combination with the alkaline chlorides, forming numerous distinct compounds. (A double chloride of ammonium and mercury, represented by the formula $3H_4NCl, HgCl + Aq$, has been long known as *sal alembroth*.) It combines with oxide of mercury in various proportions, forming a class of compounds of great interest in theoretical chemistry, termed *oxychlorides of mercury*. On adding a solution of corrosive sub-

limate to a solution of ammonia in excess, a compound, which, from its physical characters, is termed *white precipitate*, is thrown down, which is generally supposed to be a compound of chloride with amide of mercury, $HgCl.HgNH_2$ (Kane). Chloride of mercury coagulates albumen, and combines with the albuminous tissues generally, forming sparingly soluble compounds. Hence, in cases of poisoning with the salt, the white of raw eggs is the best antidote; and for the same reason corrosive sublimate is a powerful antiseptic, and is employed to preserve anatomical preparations.

Amongst the most important tests for this substance, which is not unfrequently used as a poison, may be mentioned—1. Iodide of potassium, which, when added to a crystal or to a watery solution of chloride of mercury, gives rise to the formation of a bright scarlet iodide of mercury. 2. The galvanic test, which may be applied in various ways, of which the simplest is the "guinea and key test," devised by Wollaston. He placed a drop of the fluid suspected to contain corrosive sublimate on a guinea, and simultaneously touched it and the surface of the guinea with an iron key; metallic mercury was deposited on the gold in a bright silvery stain. 3. Precipitation on copper, and reduction. To apply this test, we acidulate the suspected fluid with a few drops of hydrochloric acid, and introduce a little fine copper gauze, which soon becomes coated with mercury. On heating the gauze in a reduction tube, the mercury is obtained in well-defined globules.

With iodine and bromine, mercury forms two iodides and bromides, corresponding in composition to the chlorides. Both the iodides are used in medicine; the bromides are of no practical importance. The *subiodide* (Hg_2I) is a green powder formed by triturating 5 parts of iodine with 8 of mercury, and is of far less interest than the *iodide* (HgI), which is most simply obtained by precipitating a solution of corrosive sublimate by a solution of iodide of potassium. The precipitate is at first salmon-colored, but soon changes into a brilliant scarlet crystalline deposit.

Sulphur forms two compounds with mercury—viz., a subsulphide (Hg_2S), a black powder of little importance, and a sulphide (HgS), which occurs naturally as cinnabar (q.v.). *Sulphide of mercury* is thrown down as a black precipitate by passing sulphureted hydrogen through a solution of a persalt of mercury (corrosive sublimate, for example). When dried and sublimed in vessels from which the air is excluded, it assumes its ordinary red color. The well-known pigment *vermilion* is sulphide of mercury, and is sometimes obtained from pure cinnabar, but is more frequently an artificial product.

Mercury unites with most metals to form amalgams (q.v.), several of which are employed in the arts.

Of the numerous organic compounds of mercury, it is unnecessary to mention more than the fulminate (described in the article FULMINIC ACID (q.v.), and the cyanide (HgCy), which may be prepared by dissolving the red oxide of mercury in hydrocyanic acid, and is the best source from which to obtain cyanogen.

The uses of mercury are so numerous that a very brief allusion to the most important of these must suffice. It is employed extensively in the extraction of gold and silver from their ores by the process of amalgamation. Its amalgams are largely employed in the processes of silvering and gilding, and some (as those of copper and cadmium) are employed by the dentist for stopping teeth. It is indispensable in the construction of philosophical instruments, and in the laboratory in the form of the mercurial bath, etc. It is the source of the valuable pigment vermilion. The use of its chloride in anatomical preparations has been already noticed; it is similarly found that wood, cordage, and canvas, if *soaked* in a solution of this salt (1 part to 60 or 80 of water), are better able to resist decay when exposed to the combined destructive influence of air and moisture. The uses of mercury and its preparations in medicine are noticed in a separate article.

MERCURY AND **MERCURIALS**, MEDICINAL USES OF. Liquid mercury is no longer used in medicine, although, until lately, it was occasionally given with the view of overcoming, by its weight, obstructions in the intestinal canal. There are, however, many preparations which owe their value to *extinguished* mercury; that is to say, to mercury triturated with chalk, saccharoid matters, oil, etc., till globules can no longer be detected in it. It is possible that, in these cases, the metal is partly reduced to the state of suboxide. Amongst these preparations must be placed *mercury with chalk*, or *gray powder* (*hydrargyrum cum creta*), which is the mildest and best mercurial to administer to infants and children, the dose varying with the age; *blue pill* (q.v.); and the various ointments, liniments, and plasters of mercury. *Calomel* (termed, in some of the pharmacopœias, *hydrargyri chloridum*, for the same reason that corrosive sublimate, as already mentioned, is termed in the same works *hydrargyri bichloridum*) is perhaps more given than any other medicine of this class, and may be regarded, in so far as its actions are concerned, as a type of mercurials generally. Given in small doses, the first effects of these medicines are observed in the increase of the various secretions, as, for instance, of the saliva (see SALIVATION), of the various fluids poured into the intestinal canal,* and sometimes

* It is very doubtful whether, as is generally believed, mercurials increase the secretion of the essential constituents of the bile. The watery portion is undoubtedly, and the coloring matter probably, increased.

of the urine. When continued in small doses for some time, they cause the absorption of morbid fluids, and even of morbid products that have assumed a partially solid form. The following are some of the diseases in which they are of most importance: (1) In *internal congestions*, as of the liver, etc., to increase the secretions, and hence relieve the vessels of the affected organ; (2) in various *acute inflammations*, especially of serous membranes (q.v.), of the structure of the liver and of the lungs, etc.; (3) in numerous forms of *chronic inflammation;* (4) in *dropsies*, dependent upon inflammation of serous membranes or disease of the liver, but not in dropsy from disease of the kidneys, where they are generally injurious; (5) in numerous *chronic affections* in which an alterative action is required; and (6) as a purgative (to be followed by a black draught), when a patient is in the condition popularly known as bilious (in this case, blue pill is usually as efficacious as calomel).

In *syphilis*, mercurials were at one time universally prescribed; now they are not considered essential to the cure of this disease, except in comparatively few cases.

If calomel, blue pill, or any other mercurial be given in too large a dose, or for too long a period, most serious consequences may result—such as very profuse salivation, with swelling of the tongue and gums, and loosening of the teeth; purging; certain skin affections; disease of the periosteum and of the bones (formerly ascribed to syphilis, but in reality oftener due to the supposed remedy); and a low febrile condition (termed mercurial erythism), accompanied with great general prostration.

The doses of calomel for an adult vary from 3 to 6 grains when taken as a purgative. If the object is to affect the system generally, as in a case of acute inflammation, small doses (half a grain to two grains, combined with a little opium) should be given several times a day; while as an alterative, still smaller doses (not sufficient at all to affect the mouth) should be prescribed. The *compound calomel pill* popularly known as *Plummer's pill* (in which the calomel is associated with oxysulphide of antimony and guaiacum) is a most valuable alterative in chronic skin-diseases—a five-grain pill to be taken every night.

Corrosive sublimate (the *bichloride* of the pharmacopœias, and *oxymuriate* of the older chemists), although a very powerful irritant poison, is extremely useful in very small doses as an alterative in many chronic affections of the nervous system, the skin, etc. The dose varies from one-thirtieth to one-eighth of a grain; the average dose of its pharmacopœial solution, the *liquor hydrargyri bichloridi*, being one dram, which contains one-sixteenth of a grain of the salt. This medicine should always be given on a full stomach.

The above are the chief mercurial preparations that are given internally. Certain external applications require a few remarks. The plasters, ointments, and liniments are absorbed by the skin, and act in the same manner as mercurials taken internally.

White precipitate ointment is the universal remedy for the destruction of lice, and is a useful stimulating application in chronic skin-diseases. *Ointment of nitrate of mercury*, popularly known from its yellow color as *citrine*, or *golden ointment*, is, when sufficiently diluted a most useful stimulating application in inflammation of the eyelids, in indolent ulcers, etc.; and the *ointment of nitric oxide of mercury* is similar in its action. The precipitated suboxide that occurs in *black wash*, and its use as a local application, are described in the article LINIMENTS.

The *toxicological* relations of the mercurial compounds must be briefly glanced at. There are cases on record in which, probably from some peculiarity of constitution, ordinary and even small doses of the milder mercurials have caused death; thus, Christison mentions a case in which two grains of calomel destroyed life by severe salivation and by ulceration of the throat; and similar cases in which small doses of gray powder, blue pill, and calomel have proved fatal are recorded by Taylor in his *Medical Jurisprudence*. The preparations employed for the purpose of poisoning are mainly corrosive sublimate and white and red precipitates, corrosive sublimate being used in at least four-fifths of the cases. The symptoms produced by a poisonous dose of this salt come on immediately, there being during the act of swallowing an intense feeling of constriction, and a burning heat in the throat, while a metallic taste is left in the mouth. Violent pain in the stomach and abdomen is felt in a few minutes, and vomiting of mucus and blood, and purging, follow. The pulse becomes small, frequent, and irregular, the tongue white and shriveled, the skin cold and clammy, the respiration difficult, and death is preceded by fainting or convulsions. Any dose exceeding two grains would probably prove fatal to an adult, unless vomiting were induced, or the whites of eggs administered. Death commonly ensues in from one to five days, but may take place in less than half an hour, or not for three weeks or more.

MERCURY, Dog's, *Mercurialis*, a genus of plants of the natural order *euphorbiaceæ*, having unisexual flowers, a tripartite perianth, 9 to 12 stamens, two simple styles, and a dry two-celled fruit with two seeds. The species are not numerous. The COMMON DOG MERCURY (*M. perennis*) is very common in woods and shady places in Britain. It has a perfectly simple stem, about a foot high, with rough ovate leaves, and axillary loose spikes of greenish flowers. It turns a glaucous black color in drying, and the root contains two coloring substances, one blue and the other carmine; so that it may probably become of importance in dyeing. It is very poisonous. The mercury which some old writers mention

as a pot-herb is not this plant, but *chenopodium bonus henricus*. ANNUAL DOG MERCURY (*M. annua*) is a much rarer British plant, and less poisonous. The leaves are indeed eaten in Germany, as spinach. A half-shrubby species (*M. tomentosa*), found in the countries near the Mediterranean, has enjoyed an extraordinary reputation from ancient times; the absurd belief mentioned by Pliny being still retained, that if a woman after conception drink the juice of the male plant she will give birth to a boy, and if of the female plant her offspring will be a girl—the male plant, however, being mistaken for the female, and the female for the male.

MERCY, SISTERS OF, or ORDER OF OUR LADY OF MERCY, an order of the Roman Catholic church founded in Dublin in 1827. They are of two classes, choir sisters and lay sisters; the choir sisters being occupied with the visitation of the sick and prisoners, the care of poor and virtuous girls, and other charities; the lay sisters being employed in the domestic occupations of the convent, etc. Each community is independent of the rest of the order, being subject only to the bishops. The origin of the order was due to Miss Catharine McAuley of Dublin, who, born of Roman Catholic parents and left an orphan, having been educated as a Protestant, joined the Roman Catholic church, and devoted her life and ample fortune to the service of the poor. The order has been introduced into many parts of Ireland, England, Scotland, and America. After a preliminary preparation of six months, candidates assume the white veil and become novices. The novitiate lasts two years. Their vows bind them to poverty, chastity, obedience, and the care of the sick and poor.

MEREDITH, OWEN (*pseud.*). See BULWER-LYTTON, EDWARD ROBERT, Earl.

MEREDITH, WILLIAM MORRIS, LL.D., 1799–1873; b. Penn.; a graduate of the university of Pennsylvania at Philadelphia, class of 1812; commenced the practice of law about 1820, and became a distinguished member of the profession. He held many positions in the gift of his native state, representing his district in the legislature from 1824 to 1828, and was president of the city council of Philadelphia from 1834 to 1849. He was attorney-general of Pennsylvania from 1861 to 1867, was elected president of the Pennsylvania constitutional convention in 1857, and was U. S. secretary of the treasury under president Taylor from Mar. 7, 1849, to July 20, 1850. At the time of the Geneva conference on the Alabama question in 1871, he was offered the position of counsel for the United States, but declined.

MERES, FRANCIS, b. England, 1570; distinguished chiefly as being the author of *Wit's Academy, a Treasurie of Goulden Sentences, Similies, and Examples*, 1634. *Palladis Tamia: Wit's Treasurie, being the Second Part of Wit's Commonwealth, a Comparative Discourse of our English Poets with the Greek, Latin, and Italian Poets*, appeared in 1597. His references to Shakespeare are considered of value as showing the number of works by that author produced up to that time; in his review of the literature of the day, his criticisms are considered for the most part just. He published *God's Arithmetique*, 1597—a sermon on Eccles. v. 9. He was author of a translation of the *Sinner's Guide* by Fray Luis de Granada.

MERGANSER, *Mergus*, a genus of birds of the family *anatidæ*, having a slender, straight, much compressed bill, hooked at the tip, and notched at the edges, almost furnished with teeth. See BILL. The species are all inhabitants of the seas and coasts of northern regions, but migrate southwards in winter. The goosander (q.v.) is the largest and best known British species. The REDBREASTED MERGANSER (*M. serrator*) is plentiful in the northern parts of Britain, at least in winter, and is found in all the northern parts of the world. It is not much smaller than the goosander, which it much resembles.—The HOODED MERGANSER (*M. cucullatus*), a smaller species, only about 18 in. in entire length, is a very rare visitant of Britain, but is very plentiful in North America.

MERGER, in law, is the absorption of one right, estate, interest, or offense in another of a higher degree vesting in or committed by the same person. The doctrine of merger is most commonly brought to bear in the case of real estate. Thus, where there is no intervening estate between a greater and a less limited to the same person, the less estate is absorbed or merged in the greater. If an assignment of the mortgage is made to the mortgager, the whole estate vests in him. Or if the reversion in fee simple come to the tenant for years, either by descent or purchase, his term for years is merged in the fee. But both estates, to produce a merger, must be held by the same person, by one right, and at one time. Merger occurs either upon the meeting, in the same person, of an estate of higher and an estate of less degree, or by the meeting in the same person of the reversion and the particular estate. The inferior estate is extinguished by the merger, but the greater estate remains the same as before the merger. As a rule, whenever the legal and the equitable estates meet in one and the same person, the former absorbs the latter. But a court of equity will not allow the two interests to be merged, if such merger would be contrary to the intentions of the parties, or if, without prejudice to other parties, the legal and equitable estates can be kept apart, to the profit of the party in whom they would otherwise merge. Instances of a partial merger may occur, where an estate is merged in part, and exists in part. Thus, if a tenant for years acquire the reversion of part of the leased property, he owns part of the property leased in fee-simple, and is a

tenant as to another part. Where two estates meet in the same person but by different rights, merger will not take place.—In criminal law a less offense is merged in a greater which includes it. Thus, every assault includes a battery. But where the offenses are of an equal degree, merger will not take place. In torts, when a felony is also a tort, for which a private person may institute a civil action, the private wrong merges in the public wrong. But the merger in such cases is not complete, and, upon the conviction of the criminal, the civil remedy is revived. This rule of merger in the criminal law obtains in England, where criminal prosecutions are usually conducted by private persons, and the justification of it is to be found in the fear that criminals would not be prosecuted, if the injured person could first obtain civil satisfaction. In this country, criminal proceedings are generally conducted by public prosecutors, and the English doctrine of criminal merger does not obtain. In England itself, it applies only to actions of tort and trespass. Merger is also extended to contracts. Thus, against a debtor by specialty, the remedy for breach of an ordinary simple contract is merged in the higher remedy upon the specialty, and the creditor can resort to the latter only. So where a creditor has obtained a judgment against his debtor by contract, he can only bring suit upon the judgment, if it be unsatisfied.

MER'IAN, MARIA SIBYLLA, 1647–1717; b. Germany; daughter of Matthäus Merian, a Swiss engraver, and sister of the historical painter Matthäus Merian; had a natural talent for drawing and painting, which developed in the direction of flowers and insects. She was the pupil of Abraham Mignon, celebrated for his exquisite representations of flowers, fruit, and insects. In 1665 she married Johann Andreas Graff, a painter, and removed to Nuremburg. She was never called by her married name, more fame attaching to her own, and published, 1679–83, an illustrated work in the Dutch language, 2 vols., *Origin of Caterpillars; their Nourishment and Changes.* It was translated into Latin in 1717, published in Amsterdam with a portrait of herself engraved by Houbraken; and in 1730, a French edition appeared, entitled *Histoire Générale des Insectes de l'Europe.* In 1698 she went to Surinam, and pursued her studies in South America, remaining there until 1701, publishing the result of her labor under the title of *Generation and Transformation of Insects*, 2 vols., with colored plates, and an additional volume by one of her daughters. She had 2 daughters, Jane Helen and Dorothea Maria Henrietta, who after their mother's death gave a new edition of her work to the public. The original was published in Amsterdam in 1705. In 1768–71 all her works were published, in Paris, under the title of *Histoire des Insectes de l'Europe et de l'Amerique.* A number of her original drawings, upon vellum bound in 2 vols., noted for their skill and accuracy, are in the British museum collection among the prints, and, with a portrait of herself, were the property of sir Hans Sloane. They were purchased at a great price, and the European specimens are said to be entirely original delineations, celebrated for scrupulous exactness. There are collections of her drawings in St. Petersburg, Holland, and Frankfort. She excelled as a writer no less than in the more conspicuous professions of painter and naturalist.

MERGUI', a t. and seaport of Mergui, one of the Tenasserim provinces, British Burmah, stands on an island in the delta of the Mergui river. Lat. 12° 27′ n., long. 98° 42′ east. It is about three miles in circuit, and is surrounded by a stockade. Its harbor is spacious and secure. Exports: sapan wood, dried fish, ivory, etc. Pop. '71, 9,877.

MERGUI ARCHIPELAGO, a group of islands in the gulf of Bengal, lying off the southern shores of the Tenasserim provinces, in lat. from 9° to 13° north. The islands are mountainous, some of them rising to 3,000 ft. above sea-level. Pearls are found on the coasts of many of them; and edible birds'-nests, which are sold to the Chinese and Malays, as also timber and coal, are among the chief articles of export.

MER'IAN, MATTHÆUS, the elder, 1593–1653; b. at Bâle; lived in Paris and Frankfort. He began in 1640 a work presenting perspective views of some European cities, which were drawn, engraved, and described by himself; the work is regarded as very valuable. It was continued after his death.

MER'IDA, a state in n.w. Venezuela, bounded on the n. by Maracaybo; on the e. by Truxillo and Barinas; on the s. by Barinas and the United States of Colombia; and on the w. by Pampnora. The surface consists of elevated table-lands and valleys, between the numerous mountains, off-shoots of the Andes chain, which extend through the country in all directions. The Sierra Nevada, the highest of these mountains, rises to a height of 15,066 feet. There are many rivers and extensive lakes, among which may be mentioned the Lagunilla, 3,000 ft. above sea-level. The ordinary productions of the temperate and torrid zone are grown. Area, 10,000 sq.m.; pop. 70,000, largely Indians and Mestizos. Capital, Merida.

MER'IDA, a t. of Venezuela, South America, capital of a province of the same name, about 60 m. s. of the lake of Maracaybo. It was formerly the largest and one of the most important cities of Venezuela; but in 1812 it was almost wholly destroyed by an earthquake, from which misfortune it has somewhat recovered, and is again in a flourishing condition. Pop. 6,000.

MER'IDA, the capital of Yucatan, Mexico, is situated on a barren plain, 25 m. from the gulf of Mexico, in lat. 20° 50′ n., long. 89° 40′ west. It occupies the site of a former native city, and was founded by the Spaniards in 1542. Merida has a university, a cathedral,

and 13 churches. Its port is Sizal, with which it communicates by a good road. Its trade and manufactures are not extensive. Pop. '71, 33,025, almost all Indians and half-bloods.

MERIDA (anc. *Augusta Emerita*), a small, decayed t. of Spain, in the province of Estremadura, rises on the right bank of the Guadiana, 32 m. e. of Badajoz. It is unique in Spain, and is in some points a rival of Rome itself, on account of the number and magnitude of its remains of Roman antiquity. The Guadiana is here crossed by a Roman bridge of 81 arches, and with a length of 2,575 ft., and a breadth of 26 feet. It was erected by Trajan. There is another Roman bridge over the Albarregas, 450 ft. long, and 25 ft. wide, still quite perfect, in spite of the traffic of 17 centuries. There are also remains of a castle built by the Romans; and among the other most noteworthy monuments of antiquity are an old half-Roman, half-Moorish palace, the Casa de los Corvos, constructed out of a temple dedicated to Diana, several aqueducts, an ancient theater, and a circus. Merida was built 23 years B.C., and flourished in great splendor, until, in 1229, it was taken from the Moors, after which it began to decline, Pop. 5,500.

MERIDEN, township and village in Connecticut, 18 m. n.e. of New Haven, containing the state reform school and several manufactories. Pop. '70, 10,495.

MERIDEN (*ante*), incorporated as a town in Conn. in 1806, as a city in 1867; pleasantly situated on elevated land, 94 m. n.e. of New York, and 18 m. s.w. of Hartford; pop. '80, 18,340. It has 3 post-offices, each the center of a considerable trade, called respectively Meriden, West Meriden, and South Meriden. The New York, New Haven and Hartford railroad passes through it. Meriden contains the city hall and 2 national banks. In West Meriden, the principal place, several daily and weekly newspapers are published, and it has 1 national bank. The aggregate capital of the banks in both villages is $1,000,000. They have manufactories of electro-plated silver-ware, tin-ware, cutlery, steel, cement pipe, bronzes, gas-fixtures, machinery, malleable iron, brass castings, fire-arms, and woolen goods, employing a capital of $5,000,000, with an annual product of about $15,000,000. The annual product of the britannia works, an extensive establishment, is estimated at $2,500,000, occupying several factories, and employing nearly 1000 men. The township contains 12 churches, 1 fire insurance company, 1 savings bank, a well-organized fire department, water-works, and is lighted with gas. It is one of the most enterprising and prosperous manufacturing centers in New England.

MERIDIAN (Lat. *meridies*, midday), the name given to the great circle of the celestial sphere which passes through both poles of the heavens, and also through the zenith and nadir of any place on the earth's surface. Every place on the earth's surface has consequently its own meridian. The meridian is divided by the polar axis into two equal portions, which stretch from pole to pole, one on each side of the earth. It is midday at any place on the earth's surface, when the center of the sun comes upon the meridian of that place; at the same instant it is midday at all places under the same half of that meridian, and midnight at all places under the opposite half. All places under the same meridian have therefore the same longitude (see LATITUDE AND LONGITUDE). Stars attain their greatest altitude when they come upon the meridian; the same thing is true approximately of the sun and planets; and, as at this point the effect of refraction upon these bodies is at a minimum, and their apparent motion is also more uniform, astronomers prefer to make their observations when the body is on the meridian. The instruments used for this purpose are called *meridian circles*. See CIRCLE, MURAL.

MERIDIAN, a village in e. Mississippi, at the junction, in Lauderdale co., of the Vicksburg and Meridian, and the Alabama Great Southern, on the Mobile and Ohio railroad; pop. about 4,500. It is 135 m. n.w. of Mobile, and 96 m. e. of Jackson. It contains a court-house, 5 schools, 8 churches, 5 newspapers, and 2 female colleges. Its leading industries are represented by the manufacture of cotton goods and yarn, furniture, sashes, doors, and blinds, and plows; other manufactories are foundries, machine shops, steam corn mills, and soda-water factories. It has an excellent trade, due chiefly to its central position in the midst of the lumber region, and is rapidly increasing in wealth and population. It was at this point that the troops of gen. Sherman, on Feb. 16, 1864, accomplished "the most complete destruction of railways ever beheld," according to his own official report.

MERIDIAN MEASUREMENT. The determination of the form and size of the earth from the measurement of an arc of a meridian has been a favorite problem with mathematicians from the earliest times, but up to the middle of last century their operations were not carried on with exactness sufficient to render their conclusions of much value. Since that time, however, geodesy has so rapidly progressed, owing to the invention of more accurate instruments and the discovery of new methods, that the measurement of the meridian can now be performed with the utmost accuracy imaginable. The *modus operandi* is as follows: Two stations, having nearly the same longitude, are chosen; their latitude and longitude are accurately determined (the error of a second in latitude introduces a considerable error into the result), and the direction of the meridian to be measured ascertained; then a base line is measured with the greatest accuracy, as an error here generally becomes increased at every subsequent step; and then, by the method known as triangulation (q.v.), the length of the arc of the meridian

contained between the parallels of latitude of the two stations is ascertained. As the previously found latitudes of its two extremities give the number of degrees it contains, the average length of a degree of this arc can be at once determined; and also—on the supposition that the length of a degree is uniform—the length of the whole meridional circumference of the earth. This operation of meridian measurement has been performed at different times on a great many arcs lying between 68° n. lat. and 38° s. lat., and the results show a steady though irregular increase in the length of the degree of latitude as the latitude increases. On the supposition that this law of increase holds good to the poles, the length of every tenth degree of latitude in English feet is as in the following table:

Degree of Latitude.	Length of Degree in English Feet.	Degree of Latitude.	Length of Degree in English Feet.
0°	362,732	50°	364,862
10°	362,843	60°	365,454
20°	363,158	70°	365,937
30°	363,641	80°	366,252
40°	364,233	90°	366,361

This result shows that the earth is not spherical, as in that case the length of all degrees of latitude would be alike, but of a more or less spheroidal form—that is having its curvature becoming less and less as we go from the extremity of its greater or equatorial diameter to the lesser or polar axis. See EARTH. It was by the measurement of a meridional arc that, in 1792–99, the length of a quadrant of the earth's circumference was determined, in order to form the basis of the French metrical system (see MÈTRE).

MERIMÉE, PROSPER, novelist, historian, and archæologist, was born at Paris, Sept. 28, 1803. His father, Jean François Leonore, was a painter of distinction, and secretary to the école des Beaux Arts. The son entered the college of Charlemagne, kept terms as a law-student, and became early acquainted with English and Spanish literature. The influence of Shakespeare, Calderon, and Goethe was then making itself felt in France, and the romantic school, headed by Victor Hugo, was contending for the possession of the stage against the classic traditions of Racine. Merimée, a devotee of the new sect, published under a double disguise his first work, *Le Théâtre de Clara Gazul*, a collection of studies for the stage, professing to be translated from the Spanish by a certain Joseph l'Estrange. This work raised great expectations, which were never realized. Merimée did not become a dramatist, and one of these pieces failed when represented in 1850. His next publication, also pseudonymous, *La Guzla, by Hyacinthe Maglanovitch*, was an effort to embody the spirit of the popular lays of Illyria and Montenegro. It was written to meet the then prevailing rage for Slavonic-poetry, and the materials were taken at second hand. It was, however, admired in Germany, and received the approval of Goethe. Merimée now became a regular contributor to the *Revue de Paris* and the *Revue des Deux Mondes;* and after one or two more anonymous efforts signed his name to *Tamango*. After the revolution of July he entered public life, and before long was made inspector of historical monuments, and in that capacity visited many parts of France, publishing the results of his researches in a series of reports. During all this time he continued to write for his favorite reviews a series of romantic tales, in which terrible, almost repulsive, subjects are handled with wonderful realistic power, and in a style singularly clear, condensed, and vigorous. This series, in which the *Etruscan Vase* and the *Capture of the Redoubt* are especially noteworthy, culminated in *Colomba* (1841), written by him when fresh from Corsica and its tales of vengeance. After this, his greatest and (with the exception of *Arsène Guillot*, and *Carmen*) his last romance, Merimée, applied himself to historical researches. The *Conspiracy of Catiline* and the *Social War*, studies of Roman history, preliminary to a life of Cæsar, on which he is said to have been occupied many years, appeared in 1844. In this year he was elected to the chair in the academy vacated by the death of C. Nodier. His *History of Dom Pedro the Cruel* (1848), dedicated to the countess of Montijo, the mother of the empress Eugénie, has been translated into English (1850), and reviewed in the *Edinburgh*. After the fall of the Orleans dynasty he was placed on the commission to draw up an inventory of the art treasures left by them in France. In 1854 he published his *False Demetrii*, an episode of early Russian history, the preface to which was written in prison, where he was sent for criticising, in the *Revue des Deux Mondes* (1852), the sentence passed on his old acquaintance, M. Libri (q.v.), a sentence which he tried to get reversed in the senate June 11, 1861. Merimée has also translated from Pushkin and Nicolas Gogol. Among his latest writings may be mentioned an introduction to Marino Vretro's *Poetry of Modern Greece* (1855), two brief articles in the *Revue des Deux Mondes* (1864); and *Lettres à une Inconnue* (1873; Eng. trans. 1874). Merimée was made a senator in 1853; president of the commission for reorganizing the bibliothèque Impériale in 1858; commander of the legion of honor, April 12, 1860. He was also one of the ten *membres libres* of the académie des Inscriptions. He died Oct., 1870.

MERI'NO, an important breed of sheep, originally Spanish, but now widely diffused throughout Europe, and constituting a great part of the wealth of Australia. The Merino has large limbs, and the male has large spiral horns, which do not rise above the head; the skin of the neck is loose and pendulous; the cheeks and forehead bear wool; the fleece is fine, long, soft, and twisted in silky spiral ringlets, abounding in oil, which attracts dust, so that it has generally a dingy appearance. The fleece is sometimes black, and black spots are apt to appear even in the most carefully bred flocks. The Merino sheep fattens slowly, and owes its value altogether to the excellence of its wool. It has not been found profitable in Britain, where the production of mutton is a great part of the object of the sheep-farmer.

MERINO. See WOOLEN MANUFACTURE.

MERIONES: MERIONIDIDÆ, a genus of rodents of the family dipodidæ, allied to the common jerboa (*dipus Ægypticus* of Africa and south-western Asia. The best-known species is the *meriones hudsonius*, or jumping mouse of North America (*jerboa Hudsonicus* of Baird, Labrador, southward and westward to the Pacific). It is about 3 in. long to the tail, which is from 5 to 6 inches. Its color above is light brown, lined with black; belly white, sides yellowish gray, contrasting finely with the back and belly. It takes very long and rapid leaps, moving probably with greater rapidity when pursued than any other mammal of its size See RODENTIA.

MERIONETH, a co. of Wales, is bounded on the w. by Cardigan bay, and on the n. by the counties of Caernarvon and Denbigh. Area, 385,291 acres; pop. '71, 46,598. The coast immediately south of the town of Harlech rises into cliffs, is skirted by sands, and fringed by three dangerous sandbanks at some distance out to sea. Merioneth is the most mountainous co. in Wales, although its peaks do not rise to the height of some of those in Caernarvonshire. The chain comprising the highest peaks runs from n.w. to s.e., and its summits are Arran Mowddy (2,955 ft.) and Cader Idris (q.v.). The county is watered by the Dee, which flows n.e., and by the Mawddach and the Dovey, which reach the sea after a s.w. course. The soil of Merioneth is generally poor, and large tracts are unfit for profitable cultivation. Of the total acreage only 151,291 acres were under crop in 1876; and of this portion 113,698 acres were in permanent pasture. There were 376,986 sheep in the county. Slate and limestone are largely quarried; a little lead and copper is mined; and of late gold has been found in Merioneth. In 1866 there were obtained at castle Carndochan 529 oz. of gold, and at Vigra and Clogau 214 ounces. Woolens and flannels are manufactured. Chief town, Dolgelley (q.v.).

MERIVALE, JOHN HERMAN, an English scholar and translator, was b. at Exeter in 1779, studied at St. John's college, Cambridge, and was called to the bar in 1805. He contributed largely to Bland's *Collections from the Greek Anthology*, published in 1813, and brought out a second edition himself in 1833. From 1831 to his death in 1844 he held the office of commissioner of bankruptcy. Among his other literary performances may be mentioned *Poems Original and Translated* (1841), and *Minor Poems of Schiller* (1844). MERIVALE, the rev. CHARLES, son of the preceding, was b. in 1809, studied at St. John's college, Cambridge, where he took his degree in 1830, and was successively scholar, fellow, and tutor. He has acquired a great reputation as an author by his *Fall of the Roman Republic* (1853), *History of the Romans under the Empire*, 8 vols. (1859–65), and Boyle lectures (1864–65), etc. Merivale was installed dean of Ely in 1869. Another son, HERMAN, born in 1805, was appointed prof. of political economy at Oxford in 1837, and permanent under-secretary of state for India in 1859. In the same year he was made C.B. He also wrote on colonization. He died on Feb. 8, 1874.

MERIWETHER, a co. in w. central Georgia; bounded w. by the Flint river, and is drained by many tributary creeks; 550 sq.m.; pop. '80, 17,651—9,836 colored. The surface is hilly and varied. The staples are cotton, Indian corn, and grass; of cotton there are produced not far from 10,000 bales yearly. There are many mineral springs in the co., of which the largest is at Warm springs on Pine rock, 40 m. n.e. of Columbus; it discharges 1400 gallons a minute; the water has a temperature of 90° Fahr., and contains magnesia, carbonic acid, etc. Chief town, Greenville.

MERIWETHER, DAVID, 1755–1825; b. Va.; a soldier at the siege of Savannah 1778–79, in which he was taken prisoner by the British. In 1785 he removed to Georgia and filled several offices in the gift of the state, representing his district in the legislature, and was member of congress 1802–07 as representative from Georgia. He was an earnest supporter of president Jefferson, whose policy he cordially indorsed, and was appointed by him Indian commissioner to adjust the claims of the tribe of Creek Indians in Florida. In 1817 he was chosen presidential elector, and the same year was on the commission with gen. Andrew Jackson and gov. McMinn of Tennessee, to treat with the Cherokee Indians of Georgia, which was concluded July 8, 1817, by which an extensive tract of land, w. of the Appalachee river, was added to the territory of the United States, opening the cotton-growing region of Georgia, now thickly populated, intersected by railroads, and furnishing granite, iron ore, and gold to the mineral wealth of the country. In 1821 he was again chosen presidential elector.

MERLE. See BLACKBIRD, *ante*.

MERLE D'AUBIGNE, JEAN HENRI, a popular ecclesiastical historian, was b. at **Eaux**-Vives, near Geneva in Switzerland, Aug. 16, 1794, studied there and at Berlin—under Neander—and subsequently became pastor of the French Protestant church in Hamburg. Thence, after a residence of five years, he proceeded to Brussels, became chaplain of king William, who, after the revolution of 1830, invited him to Holland, as tutor to the prince of Orange. Merle, however, declined the offer, and returning to Geneva took part in the institution of a new college for the propagation of orthodox theology, in which he was appointed professor of church history. With the exception of some visits to England and Scotland, where he had numerous readers and admirers, he remained constantly at Geneva. The work which has given him so wide-spread a reputation is his *Histoire de la Réformation au Seizième Siècle* (1835 et seq.). It is written with the utmost vivacity, and is sometimes eloquent. Its popularity has been immense. Among Merle d'Aubigné's other writings are—*Le Luthéranisme et la Réforme* (Par. 1844); *Germany, England, and Scotland* (1848); *Le Protecteur, ou la République d'Angleterre aux Jours de Cromwell* (1848); *Trois Siècles de Lutte en Ecosse* (1850); *Caractère du Réformateur et de la Réformation de Génève*, and *Histoire de la Réformation en Europe au Temps de Calvin* (1862–77). He died at Geneva Oct. 20, 1872.

MER'LIN, *Falco æsalon* or *Hypotriorchis æsalon*, the smallest of the British *falconidæ*, scarcely exceeding a blackbird in size, but very bold and powerful, and possessing all the characters of the true falcons, with the distinction of large hexagonal scales on the front of the tarsi. It is of a bluish ash color above; reddish yellow on the breast and belly, with longitudinal dark spots, the throat of the adult male white. The wings reach to two-thirds of the length of the tail. It builds its nest on the ground, and is fond of localities where large stones are plentiful, on which it is often to be seen perched, and is therefore often called the *stone falcon*. It is common in most parts of Europe, is found in Asia and North America, and extends southwards in Africa, even to the cape of Good Hope. It was of great repute in the days of falconry, being very easily trained, and flying readily at its quarry. It was therefore often used for taking partridges and wood-pigeons. It is a very lively bird, and often utters a harsh scream. It usually flies low and very rapidly, threading its way, if necessary, through branches and leaves, but it will also follow its prey in mounting upwards to a great height.

MERLIN, the name of an ancient Welsh prophet and enchanter, who is believed to have flourished during the decline of the native British power in its contest with the Saxon invaders. Both the Cambrian and the Strathclyde Britons boasted of a Merlin who was, in all probability, the same personage decked out in different legendary guise.—The Cambrian Merlin called *Merlin Emyrs* or *Ambrosius*, is said by Geoffrey of Monmouth, in his *Historia Brittonum*, to have lived in the 5th c., to have sprung from the intercourse of a demon with a Welsh princess, and to have displayed the possession of miraculous powers from infancy. He is alleged to have been the adviser of King Vortigern, and subsequently of Ambrosius, Uterpendragon, and the great King Arthur. He is often alluded to by our older poets, especially Spenser, in his *Fairy Queen*, and also figures in Tennyson's *Idylls of the King*. He has been made the subject of a metrical romance, of which there is a manuscript copy in the advocates' library in Edinburgh. (For an analysis of this romance, see Ellis's *Specimens of Early English Metrical Romances.*) A collection of prophecies attributed to him appeared in French (Paris, 1498), in English (Lond. 1529 and 1533), and in Latin (Venice, 1554); and their existence is traceable at least as far back as the time of the poet Lawrence (*circa* 1360).—The Strathclyde, or—if we may be allowed an expression which anticipates history—the *Scottish* Merlin, called Merlin the Wyllt, or Merlin Caledonius, is placed in the 6th c., and appears as a contemporary of St. Kentigern, bishop of Glasgow. His grave is still shown at Drummelzier on the Tweed, where, in attempting to escape across the river from a band of hostile rustics, he was impaled on a hidden stake. A metrical life of him, extending to more than 1500 lines, professedly based on Armoric materials, and incorrectly ascribed to Geoffrey of Monmouth, was published by the Roxburghe club in 1830. His prophecies—published at Edinburgh in 1615—contain those ascribed to the Welsh Merlin.

MER'LON, in fortification, is the portion of the parapet between two embrasures. Its length is usually from 15 to 18 feet.

MERLU'CIUS, a genus of fishes belonging to the cod family. See HAKE, *ante*. The American hake (*M. albidus* of DeKay), called whiting in New England, and also silver hake, is from one to two feet long, the upper part of the body rusty brown, with golden hues, by reflection, while alive. It is silvery white on the belly, and the iris has a silvery appearance. Lower jaw longer than upper; teeth long and sharp. It is abundant in British America, and as far south as New Jersey. It is very voracious, and devours many of the smaller fishes. Another American hake belongs to the genus *phycis* (q.v.)

MERMAID (i.e., sea-maid), an imaginary inhabitant of the sea. The upper parts of mermaids are represented as resembling those of a human being, generally of a female—although the *merman* is also sometimes heard of—whilst the body terminates in a tail like that of a fish. There is an evident affinity between the stories concerning mermaids and those concerning the sirens and tritons, perhaps also the nereids, of the ancients. The probability is that these stories have originated in the appearance of seals, wal-

ruses, and perhaps still more of the herbivorous cetacea, in regions where they are rare, or to persons unaccustomed to see them. "Large allowances must be made for the workings of an excited imagination, in situations of solitude and apprehension, on the unexpected appearance of an extraordinary and unknown object." Many of the stories concerning mermaids belong to the northern parts of the world, where the herbivorous cetacea are of rare occurrence, and perhaps some of the solitary seals have often given occasion to them. But the herbivorous cetaceans do occasionally wander into the British and probably even into more northern seas. Sir James Emerson Tennent says concerning the dugong (q.v.): "The rude approach to the human outline, observed in the shape of the head of this creature, and the attitude of the mother while suckling her young, holding it to her breast with one flipper, while swimming with the other, holding the heads of both above water; and when disturbed, suddenly diving and displaying her fish-like tail—these, together with her habitual demonstrations of strong maternal affection, probably gave rise to the fable of the mermaid; and thus that earliest invention of mythical physiology may be traced to the Arab seamen and the Greeks, who had watched the movements of the dugong in the waters of Manaar." It is right, however, that we should bear in mind the possibility of the existence in the ocean of cetaceans not yet known to naturalists.—The mermaid is a not unfrequent heraldic bearing. In the heraldry of France, she is called a siren, and in Germany she is occasionally furnished with two fishy tails.

MERMAID'S GLOVE, *Halichondria palmata*, a sponge pretty common in the British seas, and the largest of British sponges. It grows in deep water, and is sometimes two feet in height. It receives its name from the somewhat finger-like arrangement of its branches. It is not slimy, and has a very porous surface; rough, with myriads of minute fragile spiculæ. Its color is yellowish.

MER'ŌDACH, or BEL MER'ODACH, the name of a Babylonian god, as is evident from its occurring in Jer. i. 2 in connection with idols. It is supposed to be the name of a planet, either Mars or Jupiter. It is supposed to be derived from the Persian and the Indo-Germanic *mord* or *mort*, which means death, and the affix *och* found in many Assyrian names, as Nisroch, etc. Merodach was identical with the famous Babylonian Bel or Belus, the word being first probably a mere epithet of the god, and by degrees superseding the proper name. But the names were sometimes distinguished. The golden image in the temple of Babylon seems to have been worshiped as Bel rather than Merodach, while other idols may have represented him as Merodach. The temple described by Herodotus as the temple of Belus is, in the inscriptions, the temple of Merodach. But we do not know what the distinction was between the two names. It is not clear what the aspect of the god was when worshiped. Bel Merodach is represented as the "old man of the gods," "the judge," and Nebuchadnezzar calls him the great lord, "the most ancient," and Neriglissur the "first-born of the gods," "the layer up of treasures." He is regarded as the source of all power, and thus concentrates in his own person the greater part of that homage which had previously been divided among the various gods of the Pantheon. The Babylonian kings were often named after him, as Merodach Baladan, Evil Merodach, etc.

MÉRODE, FRANÇOIS XAVIER MARIE FRÉDÉRIC GHISLAIN DE, 1820–74; b. Brussels; a grand-nephew of Lafayette. His father, count Félix de Mérode, had been offered and refused the Roman Catholic candidature for the throne of Belgium. His son at first entered the army and took part in the Algerian campaign. In 1848 he began the study of theology at Rome, where he was ordained to the priesthood in 1850. Pius IX. at once made him his chamberlain, and canon of St. Peter's. In 1860 he was appointed temporary minister of arms, and recruited, chiefly from foreigners, a pontifical army. In 1865 he went out of office in consequence of a dispute with cardinal Antonelli. The next year he was made archbishop of Melitene, and papal almoner. In 1869, at the instance as is supposed of his brother, count Montalembert, he resisted the declaration of the doctrine of papal infallibility; but he acquiesced in the final enunciation of it by the ecumenical council. He gave liberally for the foundation of charitable and educational institutions, and the improvement of public grounds and streets in Rome.

ME'RŎË. See ETHIOPIA.

MEROM, or HÛLEH, LAKE, generally regarded as the waters of Merom, where the assembled forces of the confederate kings of Canaan were defeated by Joshua, is at the n. end of the Jordan valley, where it forms the central part of a low plain, 16 m. long and 7 wide, and surrounded with hills of various heights. The lake itself is triangular at the base, of which towards the north the upper Jordan enters and from its apex flows out again towards the s. on its steep descent to the sea of Galilee. The falling rains and melting snows periodically increase its size, but its average length is about 4½ m. and its width 3½. It is surrounded with marshy ground covered with a dense jungle of canes, the home of wild swine and ill-looking buffaloes that are often seen wallowing in the mud or standing almost immersed in the water. The lake is shallow and is covered for acres with yellow and white water lilies and with the true Egyptian papyrus. Hûleh is one of its ancient names, which Josephus employs for the region under the form *Ulatha*, while he calls the lake itself *Semechonitis*. The district as well as the lake is still called

Hûleh, is very fertile, but inhabited only by a few Arabs who dwell in tents. There is not a village or a house in any part of it.

MEROP'IDÆ. See BEE-EATER.

MEROPIS. See Cos, *ante.*

MEROSTOM'ATA (Gr. *meron,* thigh; *stoma,* mouth), an order of crustaceans comprising two sub-orders, eurypterida (Gr. *eurus,* broad; *pteron,* wing) and xiphosura (Gr. *xiphos,* sword; *oura,* tail), the latter including the only living representative, the king-crab, or horse-shoe crab. The first of these sub-orders is extinct, and their fossils are exclusively paleozoic, all the members being confined to the Silurian, Devonian, and carboniferous formations. The sub-order eurypterida is described by Henry Woodward as composed of "crustaceans with numerous free thoracico-abdominal segments, the first and second of which bear one or more broad lamellar appendages upon their ventral surface, the remaining segments being devoid of appendages; anterior rings united into a carapace bearing a pair of larval eyes near the center, and a pair of large, marginal, or sub-central eyes; the mouth furnished with a broad post-oral plate or *metastoma,* and five pairs of movable appendages, the posterior of which form great swimming-feet; the telson, or terminal segment, extremely variable in form; the integument characteristically sculptured." Some of the members of this sub-order were of gigantic dimensions, as *pterygotus anglicus,* measuring 6 ft. or more in length. The berry-like bodies found in the old red sandstone of Scotland, and described under the name of *parka decipiens,* are regarded as the eggs of large crustaceans of the eurypterid group. The second sub-order, xiphosura, are characterized by Woodward as follows: "Crustacea having the anterior segments welded together to form a broad, convex buckler, upon the dorsal surface of which are placed the compound eyes and ocelli; the former subcentrally, the latter in the center in front. The mouth is furnished with a small labrum, a rudimentary *metastoma,* and six pairs of appendages. Posterior segments of the body are more or less free, and bearing upon their ventral surfaces a series of broad lamellar appendages; the telson, or terminal segment, ensiform." The only living members of this sub-order are the *limuli,* commonly known as king-crabs, horse-shoe crabs. They inhabit the Indian and Japanese seas, the Antilles, and the coasts of North America. The xiphosura commenced their existence in the upper Silurian formation, where they are represented by the *neolimulus falcatus* of Henry Woodward. In this genus the head-shield has a resemblance to that of the king crab, and there are traces of a divisional line crossing the head, and apparently corresponding with the facial suture of the trilobites (q.v.). Compound eyes and ocelli seem to be present, and there are six free thoracic, and probably three free abdominal segments, of which only two have been preserved. No members of the sub-order have been found in the Devonian formation, but several types occur in the carboniferous, the most important member being *pestwichia rotundifolia* of the coal measures of Europe, and the genus *euproöps* of the North American coal measures, very similar to each other, the latter, however, having eyes situated on the anterior edge of the cephalic buckler. Limuloid crustaceans are also found in the permian and triassic formations, as well as in the upper Jurassic, the cretaceous, and tertiary. See INVERTEBRATA.

MEROVIN'GIANS, the first dynasty of Frankish kings in Gaul. The name is derived from Merwig or Merovaens, who ruled about the middle of the 5th c., having united a few tribes under his sway. His grandson, Chlodwig or Clovis (q.v.), greatly extended his dominions, and on his death divided his kingdom among his four sons, one of whom, Chlotar or Clotaire I., reunited them under his own sway in 558. On his death, in 561, the kingdom was again divided into four parts—Aquitaine, Burgundy, Neustria, and Austrasia. His grandson, Clotaire II., again united them in 613; but after his death, in 628, two kingdoms, Neustria and Austrasia, were formed, in both of which the Merovingian kings retained a merely nominal power, the real power having passed into the hands of the mayors of the palace. The dynasty of the Merovingians terminated with the deposition of Childeric IV., in 752, and gave place to that of the Carlovingians (q.v.), sprung from the Austrasian mayor of the palace. The chief authority for the earlier parts of the history of the Merovingians is Gregory of Tours. See also Thierry's *Recits Mérovingiens* (Par. 1839), and Pertz, *Geschichte der Merovingi. Hausmeier* (Leip. 1819).

MERRICK, a co. in e. central Nebraska; drained by Prairie creek, Loup fork, and Platte river, the latter forming its s.e. boundary; 650 sq.m.; pop., '80, 5341, showing nearly a tenfold increase from that of '70, 557. The Union Pacific railroad traverses the s.e. part of the county. The surface is rolling prairie, well wooded, and very fertile. Wheat and the other cereals are raised in large quantities. Chief town, Central City.

MERRICK, JAMES LYMAN, 1813–66; b. Monson, Mass.; graduated at Amherst college in 1830, and at the theological seminary at Columbia, S. C., in 1833; ordained as a missionary to Persia in 1834; embarked for Constantinople in 1834, and arrived in 1835 at Tabriz, Persia. Having traveled and labored among the Mohammedans for two years, he joined the Nestorian mission at Oroomiah. Returning to America in 1845 he was installed pastor of the Congregational church at Amherst, where he remained until his death. He was a faithful missionary and pastor. He had not only a thorough knowledge of Persian, but was well versed in Arabic, Hebrew, Turkish, Greek, Latin, and

French. He was much interested in the Persian language and literature, and bequeathed his property for the forming of four Persian scholarships in Amherst college and Columbia seminary. He published the *Pilgrim's Harp*, a volume of poems; *The Life and Religion of Mohammed*, translated from the Persian; *Keith's Evidences of Prophecy*, translated into Persian; *A Full Work on Astronomy*, left in MS. and translated into Persian; *A Friendly Treatise on the Christian Religion; A Treatise on the Orthography and Grammar of the English Language.*

MERRILL, Stephen M., D.D., b. Ohio, 1825; became a traveling preacher in the Ohio conference, 1846; was chosen editor of the *Western Christian Advocate*, 1868; and elected one of the bishops of the Methodist Episcopal church, 1872. His residence is at Chicago.

MERRILL, William E., b. Wis., 1837; appointed brevet 2d lieut. of engineers in 1859, having graduated first in his class at the West Point military academy; promoted to 1st lieut. in 1861, capt. in 1863, and maj. in 1867. His father, capt. M. E. Merrill, was killed in the Mexican war, where he served in the 5th U.S. infantry, under gen. Winfield Scott, falling at the head of his command in the attack on the fortress of Molino del Rey, which guarded the field of Chapultepec, Sept. 8, 1847. During the war of the rebellion William E. was appointed assistant engineer in the armies of Virginia and Ohio, and afterward chief engineer of the army of the Cumberland under gen. Rosecrans. He was present at the battles of Chickamauga, Sept. 19, 20, 1863, when the union forces under gen. Rosecrans suffered defeat by gen. Bragg, and at Missionary Ridge on Nov. 24, 1863, when the same army under gen. Grant defeated gen. Bragg. Subsequently, he went with the federal force under gen. Sherman to reinforce gen. Burnside, intrenched at Knoxville; the movement resulting in the raising of the siege and the defeat of Longstreet. In 1864 he raised a regiment of volunteer veteran engineers, and being commissioned col., he served with them in the departments of Tennessee, Alabama, and Georgia, in raising fortifications at unprotected points. At the close of the war he was given a commission on the staff of the lieut.gen. of the army, and engaged in improving the communications of the west, river navigation, surveys, and building roads and bridges. In 1870 he published *Iron Truss Bridges for Railroads.*

MERRIMAC, a river of New England, U.S., rising in New Hampshire, and falling into the Atlantic ocean at Newburyport, after a course of about 120 miles. It receives several small tributaries, and has numerous falls, affording immense water-power, on the principal of which are the manufacturing towns of Nashua and Manchester, in New Hampshire, and Lowell and Lawrence, in Massachusetts. Navigable 15 m. to Haverhill.

MERRIMACK, a co. in s. New Hampshire, drained by the Merrimac river intersecting it centrally, and furnishing extensive water power; 900 sq.m.; pop., '80, 46,211. It is also drained by the Contoocook, Warner, and Black rivers in the w., and Suncook river, with other branches of the Merrimac, and has numerous lakes on the east. Its surface is rough and hilly. It is well timbered, many forests of maple, pine, and oak growing along the rivers, and on the hill tops. The Winnepesaukee river forms part of its n. boundary, flowing s.w. from Great bay. It contains Kearsage mountain, 2,943 ft. above the level of the sea, 10 m. w. of lake Sunapee, which for 9 m. forms part of its n.w. boundary, the Little Sunapee lake lying a little to the north. It is traversed by the Concord railroad in the e., the Concord and Claremont railroad, and Contoocook branch, the Northern (N.H.), and the Suncook Valley railroad. Its soil is fertile, producing large quantities of fruit, all kinds of grain, wool, Irish potatoes, and dairy products. Much live stock is raised. It has quarries of the finest granite which is extensively exported. Among its manufactures are cotton goods, woolen goods, silver ware, wooden ware, iron castings, leather, carriages, lumber, and paper, machinery, bricks, furniture, leather belting, organs, etc. In the n.e. section is Shaker village, containing a Shaker church, the inhabitants being engaged in the manufacture of hosiery, corn brooms, and washing machines. Seat of justice, Concord.

MERRITT, Timothy, 1775–1845; b. Conn.; entered the ministry of the Methodist Episcopal church in 1796, and for 34 years was pastor successively in Boston, Lynn, Providence, Springfield, New Bedford, etc. While preaching at Malden he edited *Zion's Herald* in Boston, and in 1832–36 was assistant editor of the *Christian Advocate and Journal* in New York. He was a thorough scholar, an able writer, an eloquent preacher, an accomplished debater. He published *The Christian's Manual; The Convert's Guide and Preacher's Assistant; Validity and Sufficiency of Infant Baptism*, and in connection with the Rev. Wilbur Fisk, *Lectures and Discourses on Universal Salvation;* also many controversial pamphlets and sermons.

MERRITT, Wesley, b. New York, 1836; after graduating from the U. S. military academy at West Point, class of 1860, was commissioned brevet 2d lieut. of dragoons and in 1862 capt. 2d U. S. cavalry. He was on the staff of the cavalry gen. Stoneman when he made the raid on Richmond in April, 1863, and 2 months after was promoted to volunteer brig.gen. For bravery at Gettysburg, where he commanded the reserve cavalry brigade, he was brevetted maj. July, 1863. From 1863 to 1864 he commanded a cavalry division in central Virginia. He commanded a cavalry brigade under gen. Sheridan in

the Richmond campaign of 1864 and did good work at the battle of Yellow Tavern, for which he was brevetted lieut.col. May 11, 1864, and col. for the battle of Hawes's Shop, May 28, 1864. He was present at the battles of Opequan, Cedar Creek, and Fisher's Hill; and commanded a division under gen. Sheridan through the Shenandoah campaign, for which service he was brevetted maj.gen. of volunteers. He distinguished himself at Five Forks, Sailor's Creek, and at the final surrender, and was promoted to maj.gen., his commission dating from Five Forks. On July 28, 1866, he was commissioned lieut.col. of the 9th U. S. cavalry, having some months previous been mustered out of the volunteer service.

MERRY, ROBERT, 1755–98; b. in London; took a degree at Christ's college, Cambridge, and began the study of law, but was never called to the bar. Having purchased a commission in the army he was for some years a lieut. in the horse-guards. After leaving the service, Merry traveled extensively throughout Europe; and in Florence was admitted a member of the noted Della Cruscan academy. After his return to England he published many poems under the signature of Della Crusca. His ambition was to form a new school and his style is similar to that of Mrs. Piozzi and Bertie Greathead. His audacity was much greater than his genius; and the whole school of his imitators was satirized by sir Wm. Gifford of the *Quarterly Review* in his *Mæviad* and *Baviad*. In 1791 Merry married an actress, Miss Brunton, and 5 years later emigrated to the United States, and died very suddenly in Baltimore. His principal writings were: *Lorenzo; Fenelon;* and *Ambitious Vengeance,*—all dramas; and he left many fugitive poems.

MERSEBURG, a t. of Prussian Saxony, capital of a circle of the same name, on the Saale, 60 m. s.s.e. of Magdeburg. The cathedral, a noble specimen of mediæval architecture, is surmounted by four beautiful towers, and has one of the largest organs (with 4,000 pipes) in Germany. It contains the monument of Rudolf of Swabia, an aspirant to the imperial title, who was here defeated and slain (1080) by Henry IV.; a bronze plate in low relief, probably the oldest mediæval effigy extant. The castle—a picturesque edifice, mostly of the 15th c.—was once a residence of the Saxon princes. Cotton and woolen goods, paper, and tobacco are here manufactured, and bleaching and brewing are carried on. The beer of Merseburg is famous. Pop. '75, 13,678. It was near this town that the emperor Henry the fowler gained his famous victory over the Hungarians in 934.

MERSEY, an important river of England, separates, in its lower course, the counties of Cheshire and Lancashire, and has its origin in the junction of the Thame and Goyt, on the borders of Derbyshire, e. of Stockport. It flows in a w.s.w. direction, and is joined on the right by the Irwell from Manchester, at which point it becomes navigable for large vessels. Besides the Irwell, the chief affluents are the Bollin and the Weaver from Cheshire. At its junction with the Weaver the Mersey expands into a wide estuary, which forms the Liverpool channel. The estuary is about 16 m. long, and from 1 to 3 m. broad; opposite Liverpool it is a mile and a quarter in width, with a considerable depth at low water. It is much obstructed by sandbanks; but the excellent system of pilotage in practice here renders the navigation comparatively secure. Congers, shrimps, flounders, and sparlings abound in the river and estuary. Entire length with the estuary, nearly 70 miles.

MERTHYR-TYDVIL is a market t. of South Wales, with a pop., in '71, of 51,949 within the parish, which has a local board of health. The parliamentary borough embraces Aberdare and two other outlying districts; pop. 97,020. It is on the northern border of the county of Glamorgan, abutting upon the county of Brecknock, and surrounded by lofty hills. It is built upon the river Taff, 500 ft. above sea-level, 24 m. from its mouth and port at Cardiff; and it includes the junctions of the greater and lesser Taff, the Morlais, and the Dowlais, streams which there unite to constitute the main river. Merthyr-Tydvil is the seat of the iron trade of Glamorgan, as represented by the great works of Dowlais, Cyfarthfa, and Plymouth, and in a less degree by that of Penydarren. It also contains large collieries, and is celebrated, with Aberdare, for the excellence of its steam coal. The annual make of finished iron in this place, chiefly in the shape of rails, merchant-bars, girders, and ship-plates, may be stated roughly at 200,000 tons. The exports of coal are considerable, and are increasing, but the chief consumption is within the works. The population are all directly dependent upon the works, there being no other trade or manufacture. Railways branch from Merthyr-Tydvil to Brecon, to Swansea, to Cardiff and Penarth, and to Newport and Hereford. The borough was created by the first reform act, and now returns two members. Its chief town-officer is the headborough of the lordship, called the "high constable," and its government is vested in a local board. Dowlais contains some fine public buildings, but Merthyr-Tydvil is deficient in this respect. Though a busy, it is not a striking place, having risen very rapidly with the local trade, and having attained nearly its present dimensions before it was under any but the ordinary parochial government. There are, however, symptoms of improvement. It is well supplied with water, and the infantile mortality, long extraordinary, is now reduced. The people, chiefly Welsh, are industrious, and, on the whole, very orderly. There are 17 established churches, and 113 dissenting chapels in the borough.

MERTON, WALTER DE, d. 1277; b. England; educated in the convent at Merton, in Surrey, and ordained to the priesthood. Henry III. raised him to the lord chancellorship in 1258, from which office he was deposed by the barons under Simon de Montfort in 1259. He returned to that office in 1261, was removed in 1263, and reappointed in 1272. He resigned two years later, when he was appointed to the see of Rochester. He founded at Basingstoke a hospital for superannuated clergymen and travelers in distress; but he is best known by his foundation of Merton college, Oxford, which was completed in 1274. This was a purely secular and literary institution, and became the model of the subsequent Oxford foundations.

MERTON COLLEGE, OXFORD. The house of the scholars of Merton, commonly called M.C., the model of all the secular colleges, was first founded in Maldon in Surrey by Walter de Merton, bishop of Rochester, and lord high chancellor, in 1264, for the maintenance of 20 scholars in the schools of Oxford, and of a warden and three or four ministers of the altar, who were to manage the property. Before 1274 he transferred his warden and ministers to Oxford—thereby not only founding his own college, but contributing in no small degree to fix the university in its present locality. The fellows were to be as many as the means of the house could maintain, and after some changes, this number was fixed by archbishop Laud at 24. They were to be elected first and chiefly from the founder's kin; but this was from an early period evaded, and the commissioners of 1852 speak of "a common belief in the university that the elections to fellowships at Merton were formerly determined by personal interest." In 1380 Dr. Wylliot, chancellor of Exeter, endowed twelve *portionistæ*, or postmasters as they are now called, equivalent to the scholars of other colleges; and in 1604 John Chamber, fellow of Eton, endowed two more—restricted, however, to foundationers from Eton. By the ordinances under 17 and 18 Vict. c. 81, considerable changes were made—six fellowships were suspended, of which two were assigned to increase the postmasterships, etc., and four to the endowment of the Linacre professorship of physiology, of value £800 per annum. The remaining 18 were thrown open, and not to exceed £250 per annum, exclusive of rooms, until the original number of 24 was restored. The number now being completed, they have reached their limiting value of £300. Sixteen postmasterships, and four scholarships (founded by Henry Jackson in 1753), each of the value of £80 a year, are open without restriction, and tenable for 20 terms from election; but the two postmasterships on the foundation of John Chamber are only to be thrown open in default of candidates from Eton being found duly qualified. This college possesses 18 benefices, to some of which, however, certain other patrons present in turn.

MERU, in Hindu mythology, a fabulous mountain in the center of the world, 80,000 leagues high. It is the most sacred of all mythical mountains, the abode of Vishnu, and endowed with all imaginable charms.

MERU'LIDÆ, or TURDIDÆ, a family of birds of the order *Insessores*, sub-order *Dentirostres*, having arched and compressed bills, which are pointed and notched, but not strongly. They are regarded by many naturalists as intermediate between the *Laniadæ* (Shrikes, etc.) and the *Sylviadæ* (Warblers, etc.). The species are very numerous, and are arranged in many genera. They are very widely distributed over the globe, some of them being found in cold and some in warm climates. Some are migratory, a few species are gregarious at all seasons, many are gregarious only in winter. They generally build their nests in trees. They feed chiefly on soft animal and vegetable substances, as berries, insects, and worms. Many of them are birds of very sweet song; some are remarkable for their imitative powers. To this family belong thrushes (among which are reckoned the blackbird, redwing, fieldfare, ring-ouzel, etc.), orioles, mocking-birds, dippers, etc.

MÉRY, JOSEPH, 1798–1866; b. France, educated at a seminary and subsequently studied law, but early developed a passion for atheistical lore, and was expelled from the seminary on that account. While reading law he had an unfortunate affair, ending in a duel, which resulted in his dismissal from the school, but not in dulling his keen sense of honor, for he was soon after one of the principals in a duel in Paris in which he was severely wounded. Subsequently he lived a dissipated life in Italy, and was ultimately obliged to leave the country. In 1821 he attacked the abbé Elicagaray in a pamphlet, and was placed under arrest, but not profiting by this seclusion he soon found himself again in durance for transgressing the laws regulating the press. The following year he went to Constantinople and returned after a short sojourn (not being on good terms with the French ambassador at that port), to edit a newspaper at Marseilles, and in 1824, found himself once more in Paris, associated with Auguste Marseille Barthélemy the satirist, and together they published *La Villéliade*, an attack on the ministry of Villèle. With him he was associated in writing verses dedicated to the Bonaparte family, and satirical verses on other administrations, and published poems, romances, and dramas in rapid succession. In 1828, they published *Napoleon en Égypte*, a lyrical poem, sending presentation copies to each member of the Bonaparte family. Among his most attractive works, some of which have been translated into English, are *Nuits anglaises*, first issued as *Nuits de Londres; Héva; La guerre du Nizam; Les confessions de Marion Delorme; Nuits d'Orient; Un carnaval de Paris;* and *Poésies intimes*, late edition 1864. He published, 1861, *Théâtre de salon*, and wrote the libretto for *Sémiramis* and other operas.

MESAG'NA, a t. of the province of Lecce, in southern Italy, situated amidst scenery of oriental beauty, 27 m. n.w. of Lecce, and surrounded by strong walls. The district around is fruitful, and yields delicious oil, which forms an important article of the trade of Mesagna. Pop. 8,500.

MESCA'LA, a river of Mexico, which takes its rise in the s.e. part of the country, not far from Puebla. Its general course is westerly and southerly; and it is about 400 m. in length, emptying into the Pacific at the port of Zacatula. It is known in the first part of its course as the Atoyac, then as the Rio Pablano, and, where it serves as the boundary line between Guerrero and Michoacan, as the Rio de las Balsas; and near the city Zacatula is known by that name. The current of the stream is exceedingly swift and the river consequently not navigable. It has been thought by the natives that the water contains poisonous mineral ingredients, and to this is ascribed the prevalence of a loathsome skin disease among the Indians living on its banks. Gold is found on its banks and especially near the mouth.

MESEMBRYA'CEÆ, or FICOIDEÆ, a natural order of exogenous plants, both herbaceous and shrubby, but all succulent. As defined by some botanists, it includes the orders *tetragoniaceæ, sesuviaceæ,* etc., of others. Of the more restricted mesembryaceæ about 400 species are known, a few of which are natives of the south of Europe, but none are British; the greater number belong to South Africa and the South Sea islands. The ice plant (q.v.) belongs to this order. The leaves of some species, when burned, yield soda in great abundance. Large quantities of barilla are made from them in the Canary islands, in Spain, and in Egypt. The seeds of some, as *mesembryanthemum crystallinum* (the ice plant) and *M. geniculiflorum,* are ground into flour to make bread. *M. geniculiflorum* is used as a pot-herb in Africa. The fruit of *M. edule* (Hottentot's fig) is eaten in South Africa, and that of *M. æquilaterale* (pig's-faces) in Australia. *M. emarcidum* is called *kou* by the Hottentots, who beat and twist up the whole plant, allow it to ferment, and chew it like tobacco. When newly fermented it is narcotic and intoxicating. Some species of *mesembryanthemum* are now common annuals in flower gardens in Britain

MESENTERY,—MESENTERIC DISEASE. The mesentery derives its name from being connected to the middle portion (Gr. *meson*) of the small intestine (*enteron*). It is a broad fold of peritoneum (the great serous membrane of the abdomen), surrounding the jejunum and the ileum, and attached posteriorly to the vertebral column. Its breadth between the intestinal and vertebral borders is about 4 in.; its attachment to the vertebral column is about 6 in. in length, and its intestinal border extends from the duodenum to the end of the small intestine. It serves to retain the small intestines in their place, while it at the same time allows the necessary amount of movement, and it contains between its layers the mesenteric vessels, the lacteal vessels, and mesenteric glands. These glands are 100 to 150 in number, and are about the size of an almond. They exert an organizing action on the contents of the lacteals, the chyle being more abundant in fibrine and in corpuscles after it has passed through them. Hence it is obvious that disease of these glands must always seriously affect the process of assimilation. The most important affection of these organs is their scrofulous or tubercular degeneration, which gives rise to the disease known as *tabes mesenterica,* a disease most common in childhood, but confined to no period of life. In the great majority of cases it is associated with, and often marked by, other results of the tubercular or scrofulous diathesis, such as pulmonary consumption, tubercular peritonitis, scrofulous disease of the spine, rickets, etc.; but sometimes the mesenteric glands seem almost exclusively affected, in which case the disease becomes sufficiently distinct to allow of easy detection. The leading symptoms are acceleration of the pulse, occasional fever, especially towards evening, loss of color and flesh, derangement of the digestive organs (constipation or diarrhea, and occasional vomiting), a steady pain in the region of the navel, increased by pressure; but perhaps the most characteristic symptom is tumefaction and hardness of the abdomen, with general emaciation. The enlarged glands can sometimes be detected by a careful examination with the hand, especially in advanced cases. The progress of the disease is generally slow, but at length hectic fever sets in, the emaciation becomes extreme, dropsical effusion appears, and the patient dies exhausted, if not cut off by the access of some acute inflammation.

The treatment mainly consists in the administration of cod-liver oil, or, if the stomach is too irritable to bear that medicine, of iodide of potassium, combined with some bitter infusion, the bowels being at the same time carefully attended to. The application of stimulating liniments, or of iodine ointment, to the abdomen is often of great service. When the disease has advanced to a considerable extent, remedies are of little use, except to palliate some of the more urgent symptoms.

Independently of the disease that has just been noticed, inflammation of these glands is by no means uncommon when the mucous membrane of the small intestine is ulcerated, as, for example, in typhoid or enteric fever.

ME'SHA, king of Moab in the reigns of Ahab and his sons Ahaziah and Jehoram, kings of Israel, and tributary to the first. He seized the opportunity afforded by the confusion which followed Ahab's death, and the feeble reign of Ahaziah, to shake off the yoke of Israel, and free himself from the heavy tribute imposed upon him. Jehoram,

on succeeding to the throne of Israel, secured the aid of Jehoshaphat, king of Judah, his father's ally, to reduce the Moabites to their former condition of tributaries. The united armies of the two kings were joined by the forces of the king of Edom. The Moabites were defeated. The king took refuge in his last stronghold, and having in vain attempted to force his way through the besieging army, he, in the madness of despair, withdrew to the wall of the city, and in the sight of the allied host offered up his first-born son and successor as a propitiatory sacrifice to Chemosh, the cruel fire-god of the Moabites. The bloody deed had the desired effect of causing the besiegers to retire to their own land. On withdrawing, however, they ravaged the country, and carried off much spoil. The Moabite stone (q.v.) is a memorial of this king.

ME'SHID, an important city of Persia, capital of the province of Khorassan, in a fertile and well-cultivated plain, on the Tejend, in lat. 36° 17′ n., long. 59° 40′ east. It is by far the most important town of the n.e. of Persia, being the center of numerous converging routes. The city presents a surprising and beautiful view from a distance. Above the walls, which are of vast circuit, shine the gilded dome of one of the most splendid mosques of the east, the beautiful minarets of the tomb of Imaum Riza, a follower of Ali, and the summits of other sacred buildings. Meshid, as the chief seat of the great sect of the Shiites, is of nearly equal importance with Mecca, the sacred city of the orthodox Mohammedans, and hence it abounds in "holy" men, arrayed in green turbans and sashes, who instruct the pilgrims visiting the city. The town carries on manufactures of woolen goods and of metal-wares, especially sword-blades, gold-work, and articles of jewelry. It is a famous place of pilgrimage, and a center, to some extent, of education. Caravans arrive almost daily. Pop. 70,000. In the neighborhood are the ruins of Thus, the old capital of Khorassan, which contains the tomb of the celebrated poet Firdûsi.

MESIL'LA, a t. and valley on the Rio Grande, New Mexico, U. S., acquired of Mexico in 1834 by purchase under the Gadsden treaty. Lat. 32° 17′ n., long. 106° 45′ west. It is a narrow, but fertile valley, on the southern overland route to California. The town, settled in 1850, had in 1870 a population of 1578.

MESMER, FRANZ (according to others, FRIEDRICH-ANTON), the founder of the doctrine of animal magnetism (q.v.), or mesmerism, was born in 1733 or 1734 at a village near the Bodensee. He studied at Vienna, and there took the degree of doctor of medicine in 1766. About 1772 he began, along with father Hell, to investigate the curative powers of the magnet, and was led to adopt the opinion that there exists a power similar to magnetism, which exercises an extraordinary influence on the human body. This he called animal magnetism, and published an account of his discovery, and of its medicinal value in 1775. Honors were conferred upon him in Germany. In 1778 he went to Paris, where he attracted much attention. His system obtained the support of members of the medical profession, as well as of others; but he refused an offer of an annual pension of 20,000 livres (about £800) to reveal his secret; and this, combined with other circumstances, gave rise to suspicion, and induced the government to appoint a commission, composed of physicians and naturalists, whose report was unfavorable to him. He now fell into disrepute, and after a visit to England retired to Meersburg, where he spent the rest of his life in complete obscurity. He died Mar. 5, 1815.

MESMERISM (*ante*). The following is the account given by Mesmer of the agent by which he claimed to produce the phenomena which distinguished his experience and practice: "Animal magnetism is a fluid universally diffused; it is the medium of a mutual influence between the heavenly bodies, the earth, and animated bodies; it is continuous so as to leave no void; its subtilty admits of no comparison; it is capable of receiving, propagating, and communicating all the impressions of motion; it is susceptible of flux and reflux. The animal body experiences the effects of this agent; by insinuating itself into the substance of the nerves it affects them immediately. There are observed, particularly in the human body, properties analogous to those of the magnet; and in it are discerned poles equally different and opposite. The action and the virtues of animal magnetism may be communicated from one body to other bodies, animate and inanimate. This action takes place at a remote distance without the aid of any intermediate body; it is increased, reflected by mirrors; communicated, propagated, augmented by sound; its virtues may be accumulated, concentrated, transported. Although this fluid is universal, all animal bodies are not equally susceptible of it; there are even some, though a very small number, which have properties so opposite that their very presence destroys all the effects of this fluid on other bodies. Animal magnetism is capable of healing diseases of the nerves immediately, and others mediately. It perfects the action of medicines; it excites and directs salutary crises in such a manner that the physician may render himself master of them; by its means he knows the state of health of each individual, and judges with certainty of the origin, the nature, and the progress of the most complicated diseases; he prevents their increase, and succeeds in healing them, without at any time exposing his patient to dangerous effects or troublesome consequences, whatever be the age, the temperament, and the sex. In animal magnetism nature presents a universal method of healing and preserving mankind." (*Mémoire sur la Découverte du Magnetisme Animal*, par M. Mesmer, Paris, 1779, p. 74 et seq).

In presenting any question for consideration and discussion it is simple fairness to

permit each side to exhibit its position after its own manner. It is matter for reflection that this statement by Mr. Mesmer has never been authoritatively controverted by any of the numerous opponents whom it has met in the century which has elapsed since it was first promulgated. It should first be remembered as to Mesmer that he was undoubtedly very much of a charlatan; and that partly from the character of his temperament, and partly from the nature of his surroundings, he accompanied his practice by methods which were designed to be striking and dramatic, rather than scientific; and to cloud with an appearance of mystery, and even supernaturalism, processes which were in themselves of the simplest character. The shrewdness of this operator is seen in his careful provision for accidents, and for the unsuccessful termination of any of his experiments or treatment by the explanation that although the fluid is universal in its scope, there are persons obnoxious to its exercise, who can prevent its influence. It should further be noted that the sweeping conclusions of the commissioners appointed by the French government to investigate the validity of Mesmer's pretensions—among which commissioners was Benjamin Franklin—were afterwards qualified materially by the decision of a second commission of no less importance as to the ability of its membership. And it remains to be said that the distinct assertions of Mesmer as to the power of some occult force which he terms animal magnetism have been sustained over and over again by actual experiment and practice; while new features and new developments of the nature of this force have been made known to us within the present generation. The theory that the cause of the phenomena produced lies in the principle of *suggestion* is set at rest positively by the fact that subjects have been influenced without the proximity of the operator, and even when the latter was miles distant from them. The point as to its efficacy in disease has been tested numbers of times with success. So far has this been the case that in India amputations have been conducted while the patient was under this influence, and this in the presence of valid witnesses, and successfully. The idea of any other than a psychological control being exercised is disposed of by the remarkable phenomena of phreno-mesmerism, by which certain faculties and propensities have been made to display themselves, by irritation of the corresponding organs of the head, and in cases where the subject was utterly ignorant of the nature and details of phrenology as enunciated by Gall and Spurzheim. The fact that such eminent scientists as Elliotson, Braid, Reichenbach, and Carpenter have added their testimony as to the existence of a certain subtle fluid, such as is described by Mesmer, is not without its bearing on this question. Baron Reichenbach, an eminent German chemist, experimented in great detail with magnets and crystals, and claimed to have demonstrated the fact of the existence of such a fluid, which he termed *od* or the *odic* force, and which he alleged could be brought into exercise in the case of a certain class of subjects termed *sensitives*, by employing these objects. His plan was the use of passes, making these, however, by means of the magnet or the crystal instead of the hand; the result being to throw the subject into a cataleptic condition, accompanied by the occurrence of phenomena similar to those otherwise attributed to animal magnetism. Braid, by the use of a brilliant object fixed to the forehead, in such a position as to distort the vision when the eyes were directed towards it, produced an identical condition (see HYPNOTISM). It will be remembered in this connection that the Hindu devotee, desirous of achieving the condition *Nirvana*, abstracts his attention from surrounding things, and fixes it upon the pit of his stomach. It has been a common method in the practice of mesmerism, instead of employing passes, to direct the subject to fix his attention and his gaze on a bright object—a ring, for instance—held in his hand, the hand resting on his knee as he sits in a comfortable position. In the use of this plan the result has been found to be precisely the same as that gained by the employment of passes.

A German writer, Kluge, has given the following classification of the effects observed in mesmerized subjects: 1. Called *waking*. Presents no very remarkable phenomena. The intellect and the senses still retain their usual powers and susceptibility. 2. Half-sleep, or imperfect crisis. Most of the senses still remain in a state of activity, that of vision only being impaired, the eye withdrawing itself from the power of the will. 3. The magnetic or mesmeric sleep. The organs of the senses refuse to perform their respective functions, and the patient is in an unconscious state. 4. The perfect crisis, or simple somnambulism. In this stage the patient is said to "wake within himself," and his consciousness returns. He is in a state which can be called neither sleeping nor waking, but which appears to be something between the two. 5. Lucidity, or lucid vision. This is called, in France, *clairvoyance;* in Germany, *Hellsehen*. In this state the patient is said to obtain a clear knowledge of his own internal mental and bodily state, is enabled to calculate with accuracy the phenomena of disease which will naturally and inevitably occur, and to determine what are their most appropriate and effectual remedies. He is also said to possess the same faculty of internal inspection with regard to other persons who have been placed in mesmeric connection (*en rapport*) with him. 6. Universal lucidity; German, *allgemeine Klarheit*. In this state the lucid vision becomes greatly increased, and extends to objects whether near or at a distance. To this very accurate catalogue we should add a condition—7. Coma. Into this state the patient falls who has been permitted to escape from the influence of the will of the operator. He no longer responds to command, he is apparently unconscious, his pulse recedes to the vanishing-point, and his heart-beats cease to be noticeable. This state closely simulates death, and is believed

to be actually premonitory of dissolution. Cases have occurred in which it has required the utmost exertion of all the methods known to those who practice mesmerism to restore to consciousness patients who had reached this condition.

The mesmeric state has been applied mostly to the cure of disease, for which purpose it was used by Mesmer when it first attracted public attention. It has also been used for the purpose of producing sleep during surgical operations; and Miss Martineau relates a case of one of her servants, who when in the mesmeric condition was said to be able to predict future events. The class of diseases which have been cured by its means are those which are known to medical men as functional nervous diseases. Various nervous diseases, such as paralysis, epilepsy, etc., occurring from changes in the structure of various organs, are not susceptible of benefit from the mesmeric state. It is in those cases where no structural lesion can be supposed to exist, and which often yield to sudden changes of the mind from various causes of excitement, and which frequently cease without obvious cause, that the disease has yielded to this remedy.

In 1836 Mr. Colquhoun published in London a work on animal magnetism, entitled *Isis Revelata*, which attracted considerable attention to the subject, and which contained as an appendix a translation of the report of the second French commission appointed to investigate this subject in 1831, and to which we have already referred. This was followed by the arrival in London of baron Dupotet, who performed many experiments, some of which were witnessed by Dr. Elliotson, who immediately undertook the further investigation of the subject. The results of the experiments of Dr. Elliotson, which were published in the *Lancet*, produced a great sensation, and phenomena which had hitherto been regarded as impossible were constantly produced. In 1841 M. La Fontaine, a Frenchman, visited London, and gave public lectures on mesmerism and examples of its phenomena. A number of persons claiming to be "professors" of animal-magnetism, or electro-biology, have from time to time given public exhibitions in the cities and towns of the United States and the British provinces in America. In these exhibitions the object has been to exhibit voluntary patients placed under the control of the operator, and to display the various phenomena which could then be produced. These have been always simple in their nature, and of a character to amuse more than to instruct. No scientific man had given himself to the investigation of this subject to any important extent in America until, during the winter of 1880–81, Dr. George M. Beard, of New York, a member of the Neurological society, and a man qualified by the nature of his studies and experience, and his avowed skepticism on this subject, to undertake its investigation with a mind at least free from bias in its favor, commenced a series of experiments, and eventually conducted certain of these in public. These experiments were none of them novel in character, except possibly that of showing the insensibility to the most powerful light of the eye of a patient in a mesmeric condition. The experiments were all conclusive as to the nature of the phenomena produced, but the inferences reached by the experimenter and those who witnessed them as to their occasion and origin have not been made public at the time of this writing. But the bald facts of the phenomena have never been disputed by intelligent investigators. Only those unaccustomed to profound investigation have set these down as the result of self-deception or of collusion. It still remains to be discovered what influence produces the conceded result, and to what extent, if at all, the human will is engaged in the matter. Something suggestive as to these points might be stated in this wise: that a subtle force pervades creation and envelops the earth, with the other planets; that this force performs specific duties in connection with vitality, and in the form of a positive ether becomes visible under certain conditions, and in the case of animals, including human beings, more readily so to those possessing certain natures and temperaments (sensitives); that this force may be and is exerted without sensible regard to time or distance; that it is subject to evolution and direction by the human will; that it is concentrated in certain material forms, as in the magnet and the crystal, and in certain atmospheric and meteorological conditions, as in snow-storms; that it is correlated with the other forces and, like these, is one of the modes of motion; that it is more elevated in its character than any of the simply material forces; because it responds to mental impressions and psychological influences; that it includes all the forms and modes of expression of all the subordinate, or strictly material, forces; that thus it is enabled to act upon things animate or inanimate, material as well as immaterial, thus accounting for the phenomena of table-tipping, so-called "spiritual" rapping, etc.; that it may even exhibit or manifest conditions simulating intelligence, wherein would appear one explanation of these phenomena in the practice of spiritualism; finally, that it is superior to material laws, whence the phenomenon of levitation, that of untying impossible knots, etc. As suggestions, merely, these may awaken interest in the general subject.

Oersted says (*Soul in Nature*), "Everything in science prevailing throughout a certain period contains actual scientific truth, though frequently much obscured." The fact that mesmerism, or animal-magnetism as it may more properly be termed, has continued to affect mankind as a possible scientific fact during more than a century of pronounced opposition, would seem to bring it within the category signified by Oersted. And in these days of investigation into the nature of things, and when such extraordinary discoveries are constantly being made as to the limitless nature and scope of the natural forces, it would appear proper to devote a certain fair degree of scientific skill and

patience in the direction of elucidating the nature and origin of such remarkable phenomena. See ANIMAL MAGNETISM, *ante*.

MESNE LORD is, in English law, a lord who is himself a tenant to some other lord, called a lord paramount. The phrase is, however, not now used, because subinfeudation was abolished in the time of Edward I.—MESNE PROCESS was the name given to writs which issued in respect of a pending action before final judgment was given.—MESNE PROFITS are the profits or rents drawn by a person who is wrongfully in possession of real property, and who is afterward ejected, in which case the mesne profits are recoverable, along with the estate itself.

MESOPOTA'MIA (Gr. *mesos*, middle, and *potamos*, a river), the region between the Euphrates and the Tigris; but the name is generally applied to the northern part of this region, which is called by the Arabs Al-Jesira (the island). The northernmost districts of Mesopotamia are mountainous, being penetrated by the southern spurs of the mountains of Armenia; all the rest is a plain, rarely broken by rocky heights. This plain is dry steppe, green with vegetation only in the wet season; but wherever it is naturally watered or artificially irrigated it displays fertility. The inhabitants consist chiefly of Turks, Kurds, Turcomans, and Yesids, with Armenians in the n. and Syrians and Arabs in the plains. The chief occupation of the people is the feeding of cattle; and of the civilization of ancient times, or even of that which prevailed in a later period (during the Ayubite rule), few or no traces now exist. Mesopotamia forms a part of the Turkish empire, and is divided into several eyalets, or governments. For the history of the country, see ASSYRIA, BABYLONIA.

MESOZO'IC (Gr. middle-life), a term introduced by prof. Phillips to designate the group of geological periods, the fossil remains of which differ equally from those of the paleozoic (ancient-life) and cainozoic (newer-life) epochs. It is synonymous with the more generally employed term secondary, and includes the rocks of the triassic, oölitic, and cretaceous periods.

MES'PILUS. See MEDLAR.

MESQUITE GRASS, a procumbent pasture-grass, abundant in the s.w. part of the U.S., and belonging to the genus *aristida*.

MESQUITE TREE. See MEZQUITE TREE, *ante*.

MESS (Fr. *mets*, Old Fr. *mes*, Ital. *messo*, a dish, from Lat. *missum*, sent or served up), originally signified a dish or portion of food; but is used in the British army and navy in the sense of a number or association of officers or of men taking their meals together. In societies consisting entirely of the male sex, and of one set of men continually thrown together, it is a very important social point that the mess should be well regulated. There are consequently stringent rules—both of the service and of mutual etiquette—laid down for its government. One officer acts as caterer, receives subscriptions from the several members, charges the wine to those who drink it, etc.; a steward has charge of the more menial department, arranging for the cooking, purchase of viands, servants, rations, etc.

In the navy, the admiralty lend the plate and glass; in the army such expenses are met by the mess fund, which is kept up by a contribution not exceeding thirty days' pay, or difference of pay, on the appointment or promotion of an officer, and an annual subscription from each officer not exceeding eight days' pay, which subscription, in the case of subalterns, is, since 1872, paid by the state. Of course, each officer has to pay periodically his share of the general expense for provisions, etc. In the navy, this expense is limited to £3 a month per head for the ward-room mess, and £1 10s. in the gun-room. In the army, there is no specific limit, but commanding officers are enjoined to enforce proper economy. Government assists the mess of regiments serving at home, and on certain foreign stations where the necessaries of life are expensive, with an annual allowance of £25 for each troop or company. The whole of this allowance is to be applied in aid of the cost of the first allowance of wine, and towards reducing the daily expense of the mess, etc. The annual vote for this allowance is about £40,000.

In regiments, there is the officers' mess, to which all the officers of the regiment are bound to subscribe their regulated entrance-fee; but it is optional with married officers to use it or not, and if they elect not to do so they are exempted from the annual contribution, and only pay for their share of the consumption on the special occasions when they may attend. The sergeants have also a mess, when the comanding officer can succeed in establishing one. It is considered necessary for discipline that these messes should be quite exclusive, though, in continental armies, and especially the French, the case is different, the utmost familiarity being encouraged between all ranks when off duty. The social equality of officers and men, due to conscription and promotion from the ranks, suffices to account for the difference of system. The sergeants draw their *rations* (q.v.), supplementing them at their discretion; the officers can draw them or not (through their messman), but on foreign stations they almost invariably do so.

There is no mess for staff-officers with an army, unless they form private arrangements among themselves.

In the British navy, if the ship be small there is one general mess—the gun-room—to which all the officers must belong. If the vessel have a considerable complement, there

is the ward-room mess (of which the captain is not an effective member, as he dines in his own suite of cabins), for the commander, lieutenants, master, chaplain, paymaster, marine officers, surgeon, assistant-surgeon, and chief engineer; the gun-room for sub-lieutenants, second masters, midshipmen, cadets, and master's assistants; and the engineers' mess (governed by the rules for the gun-room), for engineer officers below the rank of chief engineer. Officers or civilians voyaging in a ship of war as passengers are ordinarily elected honorary members of the mess to which their rank would entitle them. Rations are not issued to members of a mess; but each is granted, in lieu thereof, an allowance of £1 a month, with the power of purchasing ship's provisions at government rates.

Common seamen and common soldiers in the navy and army, respectively, *mess* together in tables comprising a certain number, according to their ratings or squads; but this has no reference to the technical meaning of messing as applied to officers, and is merely for the purpose of economy of fuel and labor in the cooking of their rations.

MESSALI'NA, VALERIA, the daughter of Marcus Valerius Messala Barbatus and wife of the Roman emperor Claudius, a woman infamous for her lasciviousness, her avarice, and the atrocities which she perpetrated. Taking advantage of the weakness and stupidity of the emperor she played the adulteress without restraint, and unrelentingly caused all to be put to death who stood in the way of her unhallowed gratifications. The best blood of Rome flowed at her pleasure. Among her victims were the daughters of Germanicus and Drusus, Justus Catonius, M. Vincius Valerius Asiaticus, and her confederate Polybius. She went so far in vice as to offer her charms for sale like a common prostitute; and at last, during a temporary absence of the emperor, she publicly married one of her favorites, C. Silius, upon which Narcissus, one of the emperor's freedmen, represented to him that Messalina was aiming at his destruction, and received orders for her execution. She was put to death by Enodus, a tribune of the guards, in the gardens of Lucullus, 48 A.D. Her name has become a by-word for crime and lust.

MESSA'NA. See MESSINA, *ante*.

MESSAPIA, the name given by the Greeks to the peninsula in the s.e. part of Italy, and called by the Romans Calabria. It was known to the Greeks also by the name of Iapygia. There were two tribes, the Salentini on the s.e. coast near Tarentum, and the Calabri in the n.e. These last the Greeks called Messapians. They were the most powerful, and from them the whole district was called Calabria and Messapia. It was very fertile and celebrated for its wine, olives, and other fruits. The Calabrian horses and the Tarentine cavalry were famous. The inhabitants occupied the cities of Hyria and Brundusium in the 8th c. B.C., when the Greek colony was founded. They fought against the Tarentine colonists and defeated them in a great battle about 473, but gradually yielded to the Greeks. In union with other tribes under the command of Pyrrhus they opposed the Romans, but after his fall were subdued in a single campaign. In the second Punic war they revolted to Hannibal, but were soon conquered.

MESSE'NE, capital of Messenia, in the Peloponnesus, founded by Epaminondas, 371 B.C. It was situated at the foot of Mount Ithome, on both sides of the Black springs. So great were the zeal and activity of the Thebans and their allies that it was completed and fortified in 85 days. The walls of the city were of stone, exceedingly strong, and well supplied towers and buttresses. The citadel was on Mount Ithome, famous in history for the protracted defense which the Messenians made in their last revolt. It was with the Acropolis the strongest city, next to Corinth, of the Peloponnesus. It was supplied with water from a fountain called Clepsydra. The city was named from the wife of Polycraon, one of the earliest rulers of the country. The ruins of it are visible at the modern village of Mavromati.

MESSENGERS, KING'S (QUEEN'S), officers employed by secretaries of state to convey dispatches at home and abroad. In former days their occupation consisted, to a considerable extent, in serving the secretaries' warrants for the apprehension of persons accused of high treason and other grave offenses against the state, nor was it unusual for them to keep the prisoners whom they apprehended at their own houses. They are now principally employed in foreign service.

MESSENGERS-AT-ARMS, the officers who execute the process and letters of the courts of session and justiciary in Scotland. They are appointed by, and are under the control of the Lyon king-at-arms (q.v.). Act 1587, c. 46, contains various provisions regarding these officers, which show that, prior to that period, the Lyon exercised jurisdiction over them, both as to their admission and the trial of complaints against them. There are a certain number of messengers-at-arms in every county of Scotland, amounting in all, at present, to about one hundred.

MESSE'NIA, a district in the s.w. of the Peloponnesus, bounded on the e. by Laconia, on the n. by Arcadia and Elis, and on the s. and w. by the sea. It was composed chiefly of extensive plains, watered by the *Pamisus* and other streams. Those plains were famous for their fertility, and particularly for their wheat-harvests. At an early period, after the Doric conquest, it rose to power and opulence. Its chief cities were Messene, Methone, and Pylos. It is chiefly noted for its two wars with Sparta, known

as the Messenian wars, the first of which (according to the common chronology) lasted from 743 to 724 B.C.; and the second from 685 to 668 B.C. In both instances the Messenians were defeated, and in consequence a great part of them emigrated to Sicily, where they took possession of Zancle, which then received the name of Messana, the present Messina. After the lapse of 300 years Epaminondas invited their descendants back to Greece, and they joyfully responded to his invitation. Messenia is the name of one of the *nomarchies* of the modern kingdom of Greece.

MESSER, ASA, D.D., LL.D., 1769–1836; b. Mass.; graduated in 1790 at Brown university, in which he was tutor in 1791, professor of languages in 1796, of mathematics and natural philosophy in 1799, and president 1802–27. He was licensed to preach by the First Baptist church in Providence; ordained in 1801, and preached occasionally, while professor and president, for churches of different denominations. After retiring from the presidency he was elected to several city offices by the people of Providence. He published several discourses and orations.

MESSERVE, NATHANIEL, d. 1758; b. N. H.; a ship-builder; one of the 304 New Hampshire men who went, in 1745, with the British forces to besiege the fortress of Louisburg, Nova Scotia, at the sight of whom the detachment of the royal battery on the shore spiked their guns and fled. He was lieut.col. of col. Moore's regiment, and rendered important service. He was present at the attack on fort Edward, in command of the New Hampshire regiment, and bravely defended the position. In 1756 he commanded the New Hampshire troops on the expedition to the French post of Crown Point, on lake Champlain. In 1758 he set out with the second expedition, under gen. Amherst, to Louisburg, then defended by the chevalier de Drucourt, but died of small-pox before reaching his destination. His son George held offices under government in New Hampshire and Massachusetts, having been appointed stamp agent in the former state and collector in Portsmouth and Boston. During the revolution George espoused the tory cause, and went to England in 1777.

MESSI'AH (Heb. *Mashiach*), equivalent to the Greek *Christos*, the Anointed, designates, in the Old Testament, the great deliverer and Savior whom the Jews expected to be sent by God, not only to restore their country to the power and splendor which it exhibited in the days of David, but even, by compelling the Gentiles to acknowledge the supremacy of the theocratic people, to raise it to the summit of universal dominion. This large conception, however, first begins to develop itself after the time of Solomon; for the oldest biblical records in their Messianic indications refer rather to the high degree of prosperity which the chosen people were to expect *for themselves*. This expectation, already visible in the Abrahamidæ, appeared for a moment to have realized itself in the conquest of Canaan; but the subsequent, and often disastrous wars (in the period of the "Judges" and of Saul), as well as the internal feuds and dissensions of the Hebrews themselves—left it, in point of fact, unfulfilled. Nevertheless, the hope of the appearance of the Messiah had rooted itself strongly in the people, and, during the glorious and peaceful reigns of David and Solomon, had so grown and enlarged that even after the secession of Israel, and during the momentous ages that elapsed until its destruction as a kingdom, not only was the hope of a universal world-sovereignty, and of an extraordinary degree of prosperity, warmly cherished, but it was also confidently expected that God would raise up a branch from the stem of David as the Messiah, the founder of the national prosperity, and the bringer-in of the all-embracing theocracy. That branch was declared to be "the anointed of the Lord," and since David applied that epithet to himself, the Jews transferred it to the deliverer whom they expected, and called him "Son of David." The prophetic writings contain many such allusions to the Messiah, whose coming was expected shortly, and even during the time of the generation then living, whose birthplace, in congruity with his Davidic descent, was announced to be Bethlehem and who, it was believed, was to be endowed with divine attributes. These prophetic allusions are commonly termed MESSIANIC PROPHECIES. Along with such, the prophets associated the idea of a forerunner (Elijah, Jeremiah, or Moses), whose function was to prepare the people for the appearance of the Messiah. The coming of the Messianic kingdom was to be preceded by a period of severe misfortune and bitter sorrows, the purpose of which was the reconciliation of the people with God (Isaiah i. 25, etc.; Joel iii.; Dan. ix.; Zech. xiii.). These sorrows are called the woes of the Messiah; they are minutely described in the second book of Esdras—an apocryphal work. Hence sprung up the idea of a suffering Messiah—widely diffused among the Jews—who, by enduring grief and shame, should make atonement for the people, and reconcile them with God. This conception was greatly strengthened by the picture in Isaiah (chapters lii. and liii.), of a "servant of God," which, in fact, is generally regarded as the most distinct prophecy of the Savior. Hence the step further of considering the Messiah an offering and sacrifice for the sins of the people was an easy one; yet, on the other hand, it is singular that no trace of this is found in the Apocrypha, not to mention the popular belief of the Jews, that the Messiah was to live forever (John xii. 34), that a crucified Savior was a stumbling-block to them (1 Cor. i. 23), that even the disciples of Jesus did not comprehend his allusions to his death, and that their faith in him as the Messiah was for long dim and doubtful. In fact, this popular belief of the Jews was the very reason why they did not

recognize Jesus as the Messiah. In the later Judaism (as it shows itself in the Talmud) the conceptions of the Messiah are rich in singularities. It was believed that the *true* Messiah, the son of David, would be preceded by another Messiah, a son of Joseph or Ephraim, who should suffer death for men as a sin-offering. Century after century the Jews have expected the former, and repeatedly have they risen and placed themselves under the standard of dreamers, fanatics, and impostors, who took to themselves the sacred name; as, for example, Bar-Cochba (q.v.) in the 2d. c.; one Moses in the isle of Candia in the 5th c.; one Julian in Palestine in the 6th c.; several in Persia and Arabia in the 12th c.; and as late as the 18th c., Sabatai Zevi in Aleppo. Even yet the hope of a Messiah is not dead in the hearts of the strict Talmudistic Jews.

The *crucial* question of theology, however, is not the form in which the doctrine (so to speak) of the Messiah was held by the Jews. All rational students of Scripture, whether "orthodox" or "heterodox," now admit that its growth was gradual, and that it acquired precision and definiteness of outline in the course of ages from its first rude phase, among the pastoral princes of the Syrian wilderness, down to that sublime yet shadowy personality—the Man of Sorrows—that continually floats before the vision of the "Younger Isaiah." The grand question is, Was this doctrine essentially a divine inspiration, an objective truth of God, or only a lofty conception of the religious soul? The strict rationalistic theologians maintain—and endeavor to prove by an analytic examination of the Gospels—that Jesus assumed the dignity of Messiah either to accommodate himself to a rooted conception of his countrymen, or partly because he had come to believe it himself—a conclusion, it is said, at which he might arrive quite honestly, since he felt that the *truth* which he taught was the real and only "kingdom of God," and that therefore he was justified in applying to himself all that was said (tropically) by the prophetic poets in old times concerning him who should usher in this "golden age" of the world's faith. The mass of orthodox theologians, on the other hand, regarding the so-called Messianic prophecies of the Old Testament as positive, divinely suggested (perhaps, even on the part of their author *conscious*) predictions of Jesus Christ, repudiate the principle of accommodation, or even spiritual application, and try to show that the Savior accepted the Messianic prophecies as literally and exclusively applicable to him. The historico-spiritual school, represented in Germany by men like Neander, Rothe, Tholuck, etc., and in England, generally speaking, by the divines of the "broad church" party, occupy a middle position between these two extremes: with the rationalists, they hold that the Old Testament doctrine of the Messiah was gradually developed, contains many human elements, and does not imply any knowledge of the historical Jesus on the part of those who announce it; with the "orthodox," on the other hand, they assert that the doctrine is the expression of a fact, not of a sentiment—that Jesus of Nazareth was actually the Son of God, the appointed Messiah, and that in him the so-called Messianic prophecies were fulfilled in a far higher sense than ever the prophets could have dreamed. It will thus be seen that the rationalists resolve the doctrine of the Messiah into a merely *subjective* religious idea; while the orthodox, and also the historico-spiritual school of theologians, hold that the doctrine was the expression of a divine fact —the *substance* of a heavenly faith.

MESSI'NA, a province in n.e. Sicily separated from the province of Calabria, in Italy, by the straits of Messina, and supposed to have been cut off from the main-land by an earthquake before the historic period; 1768 sq.m.; pop. 420,649. It includes the Lipari islands, lying n.w. of it, in the Tyrrhene sea; its coast is washed by the Ionian sea, and its s.w. boundary is the base of Mt. Etna. It contains the Neptunian range of mountains, part of the Peloric chain, which traverses the n. of Sicily. Its surface is diversified by fertile valleys, which are irrigated by heavy torrents that descend on either side of the mountains in the rainy season, but are dried by the heat of summer. Its productions are wheat, flax, argol, corn, fruits, hemp, nuts, oil and the red Faro wine; among the exports is the cordial called *vino-cotto* from Milazzo. Sulphur is found in large quantities; also granite, quartz, and mica. Its coast presents a varied outline, the town of Messina on the right of cape Faro, or Pelorus, at its extreme n.e. point, occupies the section of the coast line called from its form the "sickle," having a convenient harbor with spacious wharves defended by a fort. The whole country has been racked by wars and shaken by earthquakes, and the cities have a modern appearance, having been, in most cases, rebuilt. It is drained by the Monforte, San Antonio, and other small streams. It is divided into 4 distrelli and 116 communes. On a projection called cape Milazzo in the n. portion the sea-port town of Milazzo is built, whose inhabitants are sailors and fishermen, and the vine and olive are cultivated. Taormina, built on a steep towering cliff, overlooks the sea on the e., and contains many interesting ruins. On the n. coast are profitable manufactures of earthenware, and a Norman castle; and so substantially have the military works been laid on the natural defenses that it has been considered the Gibraltar of Sicily, and has been the scene of many ancient and modern wars. The province contains many churches and convents, and relics of antiquity of great interest, cenotaphs, tesselated pavements, etc. Its principal city of Messina, the terminus of a railway along the coast to Syracuse, is nearly opposite Reggio (ancient Rhegium), which is 9 m. s.e. across the straits of Messina, the most noted city of s. Italy.

MESSI'NA, a city of Sicily, chief t. of the province of same name, one of the most ancient and most important cities of the island, is charmingly situated on the strait of Messina, encircled by a zone of abrupt conical rocks, and commands a view of Calabria. Pop. in '71, 71,921. The town is inclosed by old walls, and has several fine squares and wide lava-paved streets. The harbor, which is formed by a projecting tongue of land curved in the form of a sickle (whence its primitive name, Zancle—Gr. sickle—see MESSENIA), is about 4 m. in circumference, and can contain a thousand ships; it is defended by a citadel and six forts; the depth is sufficient to admit vessels of large size; and the quays are spacious. The trade of Messina, chiefly in silk, oil, wine, coral, fruits, linseed, fish, etc., although less extensive than formerly, is still an important source of wealth to Sicily. The chief imports are cotton and woolen manufactures, hardwares, and other articles of colonial produce. The damasks and satins of Messina are excellent, and the fisheries important. Messina has steamboat communication with Naples, Marseilles, and Malta. In the 15th c. Messina was a renowned seat of learning; and in the 16th c. a famous school of painting was founded there by Pelidora da Caravaggio. In modern times it has undergone terrible vicissitudes, having been ruthlessly bombarded by the royal forces on several occasions during the war of independence in 1848.

MESSINA, STRAITS OF (Ital. *Faro di Messina*, Lat. *Mamertinum fretum*), between Italy and Sicily, are 22 m. in length, and vary from 2½ to 10 m. in breadth. A strong current runs through the strait, which is of great depth. See SCYLLA AND CHARYBDIS.

MES'SUAGE, the legal term used in English law to describe a dwelling-house and piece of land adjoining.

MESTI'ZO, a Spanish word meaning literally mongrel, derived originally from the Latin *mixtus*, and used in Spanish-American communities to denote the offspring of a white or creole and an Indian. A feminine form, *mestiza*, is also in use; and the word mestino is but another form of mestizo. In Mexico and Brazil are very large numbers of the mestizos, who are very light complexioned and have a remarkably clear skin, thin beards, and oblique eyes. The creole offspring of a mestiza and a white man differ very slightly from those of pure white descent. The child of a metiza mother and an Indian father is called mestizo-claro, and many of this class are of very remarkable beauty. The offspring of a mulatto and mestiza is a *chino;* of a negro and a mestiza, a mulatto-oscuro; and there are many other similar terms used by the whites to denote different admixtures of European, creole, Indian, and negro blood.

MES'TRÉ, a t. of northern Italy, in the province of Venice, and 5 m. n.w. of the city of Venice, on the margin of a lagoon. It is connected with Venice, Padua, and other places by railway. There are many villas around the town and along the road to Padua, reaching almost to that city. Mestre has a considerable transit trade. Pop. 8,500.

MÉSZÁROS, LÁZÁR, 1796–1858; b. at Baja, in Hungary. He at first studied theology, and afterwards became a law student in the university of Pesth. He became a volunteer in the Hungarian army in the war with Napoleon and gained a high reputation for gallant conduct in the campaigns of 1813–15. He rose gradually in rank, and in 1848 was col. of a hussar regiment, at which time Batthyáni became president of the new ministry, with Kossuth as minister of finance, and the rule of Metternich was overthrown. Mészáros was placed at the head of the war department, and though opposed to the adoption of extreme measures was most valuable in the reorganization of the Hungarian forces. Austria having declared its intention of subjugating Hungary, he left his place in the diet and took the command of the attempt against the Rascians in his native district, Bács. This proved a complete failure, and in Jan., 1849, his army was defeated with great loss before Kaschaw. In April of the same year the declaration of independence was issued; Mészáros was given an important command, and in conjunction with Dembinski led the patriot army which was defeated at Szöreg and Temesvár; he then fled to Turkey and was sentenced *in contumaciam* and hung in effigy by the Austrians. After residing for some years in England, France, and the island of Jersey, Mészáros emigrated to the United States, and became a citizen of Flushing, L. I. He died at Eywood, Herefordshire, England, while on his way to visit Switzerland.

METACEN'TRE. See HYDROSTATICS.

METAL (in heraldry). The field of the escutcheon and the charges which it bears may be of metal as well as of color; and the two metals in use among heralds are gold and silver, known as or and argent. It is a rule of blazon that metal should not be placed on metal, or color on color.

MET'ALINE, a metallic compound invented in 1870 by Dr. Stuart Gwynn of New York, and used in place of lubricants to counteract the friction of machinery.

MET'ALLURGY is the art of extracting metals from their ores. The operations are partly mechanical and partly chemical. Those processes which depend principally on chemical reactions for their results have reference chiefly to the roasting and smelting of ores, and are described under the heads of the different metals. But there are certain preliminary operations of a mechanical kind which metallic ores undergo, such as crushing, jigging, washing, etc., which we shall describe here, as they are essentially the

same for the ores of lead, copper, tin, zinc, and indeed most of the metals. (For IRON, see that head.)

Ores are first broken up with hammers into pieces of a convenient size for crushing or stamping. Waste material, such as pieces of rock, spar, etc., which always accompany ore, are as far as possible picked out by hand, and the ore itself arranged in sorts according to its purity. Various kinds of apparatus, such as riddles, sieves, etc., are then used for separating it into different sizes, in order to secure a uniform strain on the crushing machinery.

In one of the most approved forms of crushing-mills the ore is raised by means of small wagons to a platform, where it is ready to be supplied to the crushing-rollers through an opening. These rollers are mounted in a strong iron frame, held together by wrought-iron bars, and bolted to strong beams. Their distance apart is regulated by means of a lever to which a weight is attached. The bearings of the rollers slide in grooves, so that when any extra pressure is put upon them by a large or hard piece of ore, the lever rises, and allows the space between the rollers to widen. The crushed ore falls upon a series of sieves, which are made to vibrate. These have meshes increasing in fineness as they descend; and the upper two are so wide that pieces of ore too large to pass through them are conducted into the lower part of the bucket-wheel and raised again to the platform to be recrushed. The lower four sieves separate the remaining portion of the crushed ore into different degrees of fineness, which is collected in pits.

Instead of crushing-rollers, sometimes a stamping-mill is used, especially for tin ores, which require to be reduced to a fine powder. The stamping-mill consists of a series of upright shafts with a weighty piece of iron at the bottom of each. They are raised by means of an axle with projecting cams, and then, falling by their own weight, act like hammers.

After being crushed, the ore is washed and sifted on a jigging sieve. In one of its simplest forms the ore is placed on a table from which a sieve is filled. It is then immersed in a tub of water and a jigging motion communicated to it by a workman alternately raising and lowering a handle. This effects two purposes—it washes the ore, and separates the material into two layers: the upper consists of the lighter spar and other impurities, which are raked off; and the lower consists of the heavier and purer portions of the ore, which are now ready for the roasting furnace.

It will be apparent that in the bottom of the tub there must be a quantity of more or less valuable ore, which, from its fineness, has fallen through the sieve. This is called sludge or slime; and the minute particles of ore it contains are recovered either by simply forming an incline on the ground, and washing it with a current of water, or by using an inclined table called a *sleeping-table*. Ore which has been reduced to powder at the stamping-mill, as well as slime, is washed by this apparatus. The material is put into a chest which is placed in a sloping position, and is supplied with water on turning a stop-cock. The current carries the contents of the chest through an opening at the bottom, and spreads it, with the aid of a series of stops, or small bits of wood, over the surface of the table. A stream of water is then kept flowing over the table till the earthy impurities are all carried down into a trough, the pure particles of the ore remaining, by reason of their greater specific gravity, near the top of the table, whence they are removed to be smelted. Sometines the table is suspended by chains, and receives a succession of blows at the top from a *buffer*, moved by cams on the same principle as the stamping-mill. This arrangement is found of great advantage in dressing very poor ores.

The variety of machinery and apparatus used in dressing ores is very great, and they pass under different names in different districts, but they are all very similar in principle to those we have described.

METALS—METALLOIDS. Although each metal is considered in a separate article, there are various points regarding the general physical and chemical characters of these bodies, and the method of classifying them, which require notice.

It is not easy to define a metal. All the elements are usually divided by chemists into two groups—viz., the non-metallic bodies or metalloids, and the metals; the list of non-metallic bodies containing all those elements in which the characteristic properties of the bodies popularly known as metals (such as silver, gold, iron, etc.) are wanting; these characteristic properties being their metallic luster, their opacity, and their capacity of conducting heat and electricity. The non-metallic elements are 14 in number—viz., oxygen, hydrogen, nitrogen, sulphur, selenium, tellurium, phosphorus, chlorine, bromine, iodine, fluorine, carbon, boron, and silicon, of which five are gases, one a liquid, and the rest are solids at ordinary temperatures.

The division of the elements into these two great groups is, however, not based upon any definite scientific grounds, and it is still an open question whether some of the metalloids, as, for example, tellurium and silicon, should not be placed among the metals. The non-metallic bodies or metalloids being only remarkable as a group for their negative properties, require no special consideration, and we therefore proceed to notice the general properties of the metals.

The following are the most important of the *physical* properties of the metals:

1. All metals, unless when they are in a finely pulverized form, exhibit more or less of the characteristic luster termed metallic. Two of the non-metallic elements, iodine

and carbon, in some forms, present also a metallic luster. 2. All metals are good conductors of heat and electricity, although in very unequal degrees. 3. With the exception of mercury, all the metals are solid at ordinary temperatures. With the exception of gold, copper, calcium, and strontium, the metals are more or less white, with a tendency to blue or gray. Most of them have been obtained in crystals, and probably all of them are capable of crystallizing under certain conditions. 4. Metals are remarkable for their opacity, and, with the exception of gold, do not transmit light, even when they are reduced to extremely thin leaves. 5. All the metals are fusible, although the temperatures at which they assume the fluid form are very different (see FUSING POINTS); and some of them, as mercury, arsenic, cadmium, zinc, etc., are also volatile. 6. Great weight, or a high specific gravity, is popularly but erroneously regarded as a characteristic of a metal; while platinum, osmium, and iridium (the heaviest bodies known in nature) are more than 20 times as heavy as water, lithium, potassium, and sodium are actually lighter than that fluid. 7. Great differences are observable in the hardness, brittleness, and tenacity of metals. While potassium and sodium may be kneaded with the finger, and lead may be marked by the finger-nail, most of them possess a considerable degree of hardness. Antimony, arsenic, and bismuth are so brittle that they may be easily pulverized in a mortar; while others, as iron, gold, silver, and copper, require great force for their disintegration. Taking iron and lead as representing the two extremes of tenacity, it is found that an iron wire will bear a weight 26 times as heavy as a leaden wire of the same diameter. See DUCTILITY, MALLEABILITY. 8. It is a remarkable property of the metals that none of them are capable of being dissolved without undergoing chemical change. Sulphur, phosphorus, iodine, etc., may be dissolved, and after the evaporation of the solvent, may be reobtained with all their original properties; but this is never the case with metals.

Amongst the chief *chemical* properties of metals we next notice:

Their strong affinities to certain of the non-metallic elements. All the metals, without exception, combine with oxygen, sulphur, and chlorine, and often in several proportions, forming oxides, sulphides (formerly termed sulphurets), and chlorides. Many of them combine with bromine, iodine, and fluorine. The other compounds of this nature, excepting carbide (formerly carburet) of iron, or steel, and the hydrides of arsenic and antimony (commonly known as arseniuretted and antimoniureted hydrogen), which are of importance in toxicology, may be passed over without notice.

The metallic oxides are, without exception, solid bodies, insoluble in water, and usually present a white or colored earthy appearance. Hence the old name of *metallic calx* for these oxides.

Those oxides which are termed basic possess the property of directly uniting with the so-called oxy-acids (such as sulphuric, nitric, carbonic, and silicic acid), and of forming a new chemical compound of the second order, termed a *salt* (q.v.).

The compounds of the metals with chlorine, iodine, bromine, and fluorine, such, for instance, as chloride of sodium, or common salt (ClNa), are termed haloid salts (q.v.). The same metal may often combine both with chlorine and with oxygen in more than one proportion. For example, we have subchloride of mercury (Hg_2Cl); suboxide of mercury (Hg_2O); chloride of mercury (HgCl); oxide of mercury (HgO). For the compounds of the metals with sulphur, see SULPHIDES OF THE METALS.

Metals enter into combination with one another when they are fused together, and such combinations are termed *alloys* (q.v.), unless when mercury is one of the combining metals, in which case the resulting compound is termed an *amalgam*. It is doubtful whether all alloys are true chemical compounds. Definite compounds of the metals with each other do, however, certainly exist, and are sometimes found native, as, for example, the crystallized silver and mercury compound represented by the formula $AgHg_2$.

In consequence of their strong affinities for the metalloids, the metals are seldom found in a free or uncombined state, even in the inorganic kingdom, and never in animals or plants. The more common metals, in consequence of their strong affinity for oxygen and sulphur, are very rarely met with in the uncombined state; but some of those which are less abundant, such as gold, silver, and platinum, are found uncombined, in which case the terms *native* and *virgin* are applied to them; and other metals, as mercury and copper, occur both in a free and in a combined state. Many native alloys are found, but the ordinary sources of the metals are oxides, sulphides, chlorides, and carbonates, sulphates, and other salts. These are termed the *ores* of the metals. The methods of obtaining the metals from their various ores fall under the head of METALLURGY.

Various classifications of the metals have been suggested by different chemists. The following is probably one of the most convenient:

I.—The *light metals*, subdivided into—

1. The metals of the alkalies—viz., potassium, sodium, cæsium, rubidium, lithium.
2. The metals of the alkaline earths—viz., barium, strontium, calcium, magnesium.
3. The metals of the true earths—viz., aluminium, glucinum, zirconium, yttrium, erbium, terbium, thorinum, cerium, lanthanum, didymium.

II.—The *heavy metals*, subdivided into—

1. Metals whose oxides form powerful bases—viz., iron, manganese, chromium, nickel, cobalt, zinc, cadmium, lead, bismuth, copper, uranium, thallium.

2. Metals whose oxides form weak bases or acids—viz., arsenic, antimony, titanium, tantalum, niobium (or columbium), tungsten, molybdenum, tin, vanadium, osmium.

3. Metals whose oxides are reduced by heat—noble metals—viz., mercury, silver, gold, platinum, palladium, iridium, ruthenium, rhodium, osmium. (Several of the rare metals are here omitted.)

Another classification is that by which the metals are arranged in six groups, each group being named after a metal which possesses the common characters in a well-marked degree: viz., (1) the sodium group; (2) the calcium; (3) the iron; (4) the copper; (5) the platinum; and (6) the antimony groups.

METAMORPHIC ROCKS. Few of the deposits forming the crust of the earth remain in the condition in which they were deposited. By infiltration of a cementing fluid, by pressure, or by some other indurating agency, sand has become converted into sandstone, and clay and mud into shale. In some strata, this operation has been carried still further. There is a class of rocks, including gneiss, mica-schist, clay-slate, marble, and the like, which, while certainly of aqueous or mechanical origin, have, by intense molecular action, become more or less crystalline. To them, the convenient name metamorphic (Gr. transformed) rocks has been given by Lyell.

The metamorphic rocks were formerly considered to be the fundamental strata of the earth's crust. The original incandescent mass, it was said, losing its heat by radiation, a solid uneven crust of granite was formed. As soon as the ordinary atmospheric and aqueous agencies began to operate, a disintegration took place, and the abraded materials, carried down by the waters, were deposited in the basins which contained the boiling sea. It was thought that this not only accounted for the condition in which the metamorphic rocks now exist, but for the remarkable undulations and contortions so characteristic of these strata. Gneiss and the allied crystalline schists were accordingly placed as the lowest sedimentary strata in a division equivalent to the palæozoic period, and called the azoic, because they were destitute of organic remains, the conditions in which they were formed being opposed to the existence of animals.

It is now, however, known that metamorphic rocks occur as contemporaneous deposits in all epochs of the earth's geological history. In Canada and in the Hebrides, they are of Laurentian age; in the Highlands of Scotland, Cambrian and Silurian; in Devon and Cornwall, old red sandstone and carboniferous; and in the Alps, oolitic and cretaceous, and in some parts even tertiary. Although deposits of such various ages have been thus altered, the resulting rocks are in structure and composition very similar; their ultimate constituents do not differ from those of ordinary clays and sandstones. In all of them silica forms the largest proportion, consisting of about 60 to 70 per cent; alumina follows next, and then other substances in smaller quantities, such as lime, soda, potash, iron, etc. This similarity of composition, and the abundance of clays and sandstones, suggest the supposition that the metamorphic rocks may be nothing more than these deposits greatly altered; this is confirmed by many observed instances, in which aqueous strata are continuous with, and gradually change into, metamorphic rocks. The granite of Dartmoor has intruded itself into the slate and slaty sandstone, twisting and contorting the strata. Hence some of the slate rocks have become micaceous; others more indurated, having the characters of mica-slate and gneiss; while others, again, appear converted into a hard-zoned rock, strongly impregnated with feldspar. In some places in the eastern Pyrenees, the chalky limestone becomes crystalline and saccharoid as it approaches the granite, and loses all trace of the fossils which it elsewhere contains in abundance. These illustrations tell of changes occurring in the proximity of granite, and it has been consequently somewhat hastily concluded that this rock, coming up in a molten condition from below, has, by the radiation of its heat, produced the metamorphosis. But the observed stratigraphical position of granite, its sometimes passing by insensible degrees into gneiss, and the experiments of Solly and Bryson on its internal structure, show without doubt that this rock is, at least in many places, an extreme result of metamorphic action, and not the cause of it. To call the energy producing these results metamorphic or molecular action, is simply to hide our ignorance—we get a name, but nothing more. To speak dogmatically on a subject so obscure, is a sign of the same ignorance. The following, however, are the most probable agents that, together or separately, produced these remarkable changes:

1. *Heat.*—From whatever source derived, heat does exist, either distributed universally, or occurring locally in the mass of the earth; and where it exists, thermo-electric influences induce action, which, carried on over immense series of years, might produce in the end great changes. It is generally maintained that granite is the result of crystallization from perfect fusion, and that the strata converted into gneiss must have been reduced to a state of semi-fusion. But we know of crystallization taking place in the most compact amorphous solids without any approach to fusion, as in the axles of railway carriages; and of metamorphoric action without semi-fusion, as in the highly indurated bottoms of bakers' ovens, in which the clay is subjected to a long-continued though not a great heat; or in the sandstone floor of an iron furnace, which, from long contact with the molten iron, loses its color, becomes white and hard, and breaks with a porcelanic fracture, having, indeed, been changed into quartz rock. Besides, the frequent occurrence of cavities in the rock crystals of granite containing a fluid which fills

them only when the temperature is raised to at least 94° Fahr., shows that the crystal could not have been formed at a higher temperature. We are therefore safe in maintaining, that the heat was not in all cases so great as to produce fusion

2. *Pressure.*—This alone is sufficient to effect the consolidation and induration of aqueous deposits, converting clay or sand into solid stone. When heat is added to pressure, greater activity is likely to be the result. The undulatory movements of the earth's crust, by carrying down to great depths deposits formed on the surface, bring them under the influence of pressure, heat, and thermo-electricity, and at the same time elevate rocks that have been thus acted upon.

It is thought that heated water may be also a powerful agent, especially when it is subjected to great pressure.

These and other agents, then, operating through immense intervals of time, set in motion chemical attraction, whereby the various substances which entered into the composition of the sedimentary deposits rearranged themselves as they are found in the metamorphic rocks.

The description of the various metamorphic rocks will be found under their different names, viz., GNEISS, QUARTZITE, MICA-SCHIST, CLAY-SLATE, and MARBLE.

METAMOR'PHIC ROCKS (*ante*), geological formations which have undergone alteration of structure and sometimes of constitution. The subject of metamorphism has within a few years received much attention from geologists, and a great increase of knowledge has been the result. Rocks, such as granite, which were not many years ago regarded as primitive and older than all others, are now known to be of all ages and the result of changes or metamorphisms of other rocks. The word primitive is abolished in geology in its former absolute sense, and is only used to denote the first condition of any formation, whether old or recent. The general principles of metamorphism are treated in the article GEOLOGY. Metamorphic rocks are produced from the various sedimentary rocks, and also from volcanic products; but the chief source is the sedimentary rocks. The geological ages which have produced the greatest amount of metamorphic rocks are the Laurentian and Huronian. The Laurentian age commences in azoic time, and if the term primary could be applied to any formation it would be to the older of the Laurentian rocks; but it cannot be stated positively that they were the first formed, or, if so, that they have not undergone great alteration. In the Laurentian formations there are found many limestones, but it cannot be demonstrated that they are produced from shells, or that they contained animal life, except *eozoön Canadense* be regarded as such. See EOZOÖN. These Laurentian or archæan rocks extend over the whole globe, and either they or the rocks of which they are the metamorphosed products composed the floor of the first ocean, and constituted the foundation upon which the first life was developed. The action of water and heat caused sedimentary deposits, and when the heat was sufficiently reduced life began, and became, in some degree, an element in the process. The principal areas of archæan rocks in North America are in British America, extending in broad lines from the region of lake Superior north-west to Alaska, on one hand; and on the other, to Labrador, having the form of the letter V, inclosing Hudson's bay within the triangle. There is a much smaller region called the Adirondack, lying in the counties of Essex, Clinton, Franklin, St. Lawrence, Hamilton, and Warren, N. Y., and also an Appalachian line of Laurentian rock, including the highland ridge of Dutchess county, N. Y., and, passing through New Jersey, Maryland, and Virginia, forming the Blue ridge, and a long rocky mountain series, embracing the Wind River mountains, the Laramie range, and other summit ridges of the Rocky mountains. The rocks include granite (q.v.), gneiss (q.v.), mica schist (q.v.), mica slate (q.v.), talc (q.v.), chlorite (q.v.), syenite (q.v.), hornblende (q.v.), serpentine (q.v.), chrysolite (q.v.), apatite (q.v.), and plumbago (q.v.), which is supposed to have a vegetable, but may have had an entire mineral or inorganic origin. The archæan rocks are rich in iron-bearing minerals, as for example in the Missouri Iron mountain, containing magnetite, Fe_3O_4, and hematite, Fe_2O_3. Some of the beds are several hundred feet thick. Crystalline limestone, often occurring as statuary marble, is one of the rocks found in the archæan formations. See MARBLE. Nearly all geologic ages have produced metamorphic from sedimentary rocks, such as sandstone (q.v.), shale (q.v.), argillite, or clay slate (see ARGILLACEOUS ROCKS), massive limestones (see LIMESTONE), magnesian limestone (see DOLOMITE), hydraulic limestone (see CEMENTS), and occasionally volcanic products, as tufa (q.v.). Sandstones have passed into quartzite, quartz rock, or granular quartz. See Quartz Rock in QUARTZ, *ante*.

METAMOR'PHOSIS (Gr. change of form) denoted, in the mythology of the ancients, those transformations of human beings into beasts, stones, trees, and even into fire, water, etc., in fables of which that mythology abounded. The origin and significance of such fables it is often impossible to determine. Some of them probably originated in observation of the wonderful transformations of nature; some in a misapprehension of the metaphors employed by the older poets; and some, perhaps, in mere superstition and love of the marvelous. The wild imagination of the orientals filled their mythologies with metamorphoses in the greatest number; and the classic mythology approaches to them in this respect. They were the theme of some of the poets and other Greek authors of the Alexandrine period, and of Ovid among the Latin classics. The mediæval

literature of Europe, especially of Germany, in its fairy tales and other forms of folk-lore, is also wonderfully rich in metamorphoses.

METAMORPHOSIS OF **ANIMALS.** This term is applied to changes which certain animals undergo after their escape from the envelope of the egg, and which are of such a nature as essentially to alter the general form or the mode of life of the individual.

The most remarkable metamorphoses occur in the batrachians, crustaceans, insects, and tape-worms, and are briefly noticed in the articles on those classes of animals. For an excellent general account of the metamorphoses of animals the reader is referred to a series of articles by De Quatrefages in the *Revue des Deux Mondes* for 1853.

METAMORPHOSIS OF ANIMALS (*ante*). In the development of an animal the embryo may pass through all the stages of growth to a condition which differs from the adult only in size, proportion, and sexual characteristics, having thereafter only to be nourished to attain full development; or it may leave the egg in a condition remote from that of the adult, and then pass through a greater or less number of stages of distinctly marked characteristics. Each one of these stages is a metamorphosis, and collectively constitute the metamorphoses through which the animal passes. "When metamorphosis occurs the larva may live under conditions totally different from those under which the adult passes its existence. Thus the larva of an animal which is fixed in the adult state may be provided with largely developed locomotive organs; while that of an adult which feeds by suction may be provided with powerful apparatus for the seizure and manducation of vegetable and animal prey. The larva of a free adult may be parasitic, or that of a parasitic adult free and actively locomotive. Moreover, the whole course of development may take place outside the body of the parent, or more or less extensively within it; whence the distinction of *oviparous*, *ovoviviparous*, and *viviparous* animals" (Huxley). An example of that kind of metamorphosis in which non-parasitic larvæ become parasitic pupæ and adults is seen in the *rhizocephala*. See INVERTEBRATE ANIMALS, subkingdom annulosa, class crustacea, order rhizocephala. For further information see various parts of the article on INVERTEBRATE ANIMALS, and also INSECTS, *ante*, and LOCUSTS, and GRASSHOPPERS.

METAMORPHOSIS OF **ORGANS**, in botany, a subject of so much importance that it has been exalted to the rank of a distinct branch of botanical science, under the name of *morphology* or *vegetable morphology*. Attention to it is essential to a philosophical study of botany; yet it may almost be said that nothing was known either of its facts or its laws till the poet Goethe proclaimed them to the world in his treatise entitled *Die Metamorphose der Pflanzen* in 1790. Linnæus had, indeed, called attention to the development of organs, and the changes which they undergo, and had made this the subject of a *thesis* entitled *Prolepsis Plantarum* in 1760; but, in a manner very unusual with him, he mixed up with his observations and philosophical speculations certain fanciful suppositions, the falsehood of which soon becoming apparent caused all the rest to be neglected. Wolff afterwards extricated the true from the fanciful in the views of Linnæus, and gave them greater completeness; but he introduced the subject only incidentally in a paper on comparative anatomy, which failed to attract the attention of botanists, and probably had never been seen by Goethe, whose discovery, apparently altogether original, is one of the finest instances on record of acute observation combined with philosophical generalization.

The metamorphosis of organs is noticed in the articles on particular organs. It is only necessary here to make a very general statement of its facts and laws. A plant is composed of the *axis* and its *appendages;* the axis appearing above ground as the stem and branches, below ground as the root; the appendages being entirely above ground, and essentially *leaves;* all organs which are not formed of the axis being modified leaves. The proof of this consists very much in the gradual transition of one organ into another, manifest in some plants, although not in others; as of leaves into bracts, one of the most frequently gradual transitions; of leaves into sepals, as seen in the leaf-like sepals of many roses; of sepals into petals, as seen in the petal-like sepals of lilies, crocuses, etc.; of petals into stamens, as seen in water-lilies; and even of stamens into pistils, often exemplified in the common house-leek. The proof is confirmed and completed by observation of the monstrosities which occur in plants, particularly in the frequent return of some part of the flower to its original type, the leaf, and in the conversion of one part of the flower into another, which is often the result of cultivation, and is particularly illustrated in *double* flowers, the increase of the number of petals being the result of the conversion of stamens into petals.

A flower-bud being a modified leaf-bud (see BUD), and a flower therefore the development of a modified leaf-bud, the parts of a flower correspond in their arrangement with the leaves on a branch. But peculiar laws govern the development of organs in each species of plant. Thus the leaves in one are opposite; in another, alternate; in another, whorled; all depending on the law which governs the growth of the axis in relation to the development of leaves, which is very constant in each species; and in like manner the parts of the flower are developed in whorls around an abbreviated terminal portion of the axis, the energies of the plant being here directed to the reproduction of the species, and not to the increase or growth of the individual. The fruit itself, being formed from the pistil, is to be regarded as formed of modified leaves. Goethe truly

says: "The pod is a leaf which is folded up and grown together at its edges, and the capsule consists of several leaves grown together; and the compound fruit is composed of several leaves united round a common center, their sides being opened so as to form a communication between them, and their edges adhering together."

The metamorphosis of organs has been investigated with great diligence and success, and beautifully elucidated by Miquel, Lindley, Schleiden, and other botanists.

METAMORPHOSIS OF TISSUE. See TISSUE.

METAPHOR (Gr. *metaphora*, a transference), a figure of speech by means of which one thing is put for another which it only resembles. Thus, the Psalmist speaks of God's law as being "a light to his feet and a lamp to his path." The metaphor is therefore a kind of comparison in which the speaker or writer, casting aside the circumlocution of the ordinary similitude, seeks to attain his end at once by boldly identifying his illustration with the thing illustrated. It is thus of necessity, when well conceived and expressed, graphic and striking in the highest degree, and has been a favorite figure with poets and orators, and the makers of proverbs, in all ages. Even in ordinary language the meanings of words are in great part metaphors, as when we speak of an *acute* intellect, or a *bold* promontory.

METAPHYSICS, a word of uncertain origin, but first applied to a certain group of the philosophical dissertations of Aristotle (see ARISTOTLE). As since employed, it has had various significations, and more especially two—a larger and a more confined. In the more confined sense it is allied to the problems of the Aristotelian treatise, and is concerned with the ultimate foundations of our knowledge of existing things. What is the nature of our knowledge of the external world, seeing that mind cannot properly know what is not in contact with itself? has been asked by philosophers, and answered in various ways; and this is the great question of metaphysics (see PERCEPTION, COMMON SENSE). The name "Ontology" has been applied to the same inquiries into our cognizance of existences out of ourselves. But as the solution of this difficult question was found to involve an investigation into the nature of the human mind, it became allied with the science whose object it is to describe fully and systematically the laws and properties of our mental constitution—a science called by the various names of psychology, mental philosophy, moral philosophy; and hence metaphysics came to be an additional name for this more comprehensive department. The word is employed at the present day by writers of repute in both meanings. Thus, Ferrier's *Institutes of Metaphysic* is occupied solely with the questions connected with knowledge, or the nature of our perception of an external world; his explanatory title is, *The Theory of Knowing and Being*. On the other hand, Mansel's metaphysics is divided into two parts—PSYCHOLOGY, or the science of the facts of consciousness, which expresses the science of mind generally; and ONTOLOGY, or the science of the same facts considered in their relation to realities existing without the mind—that is, the problem of perception, or metaphysics in the narrower sense.

METAPONTUM, or METAPONTIUM, an ancient city of Magna Græcia, Italy; 24 m. from Tarentum, and 14 from Heraclea. It was founded by an emigrating tribe of the Achæans as early as 700 B.C., and perhaps before that time. In 415 B.C. we find the inhabitants allies of the Athenians in their invasion of Sicily, and for some time previous the town had evidently been in a condition of constantly increasing prosperity. Here the philosopher Pythagoras spent his last days, and in classical times his tomb was still to be seen. In the wars waged against Rome by Pyrrhus and Hannibal, the Metapontines were hostile to the imperial city. At the end of the war of Pyrrhus they were subjugated completely by the Romans, and in 212 B.C. succeeded in throwing off the yoke by admitting the Carthaginians. When the latter retreated from Italy the Metapontines, fearing the vengeance of Rome, fled with Hannibal; and the city was deserted, and soon fell into ruins, some of which may still be seen.

METASTASIO (originally **TRAPASSI**), PIETRO, one of Italy's most admired poets, was b. at Rome in 1698, of humble parents, and gave early evidence of his genius by his boyish improvisations. Metastasio having attracted the casual notice of Gravina, a famous jurisconsult of the day, the latter undertook the entire education and career of the youth, whose paternal name of Trapassi became thenceforward Grecized into Metastasio, both words being identical in signification. The young poet speedily advanced in classical and general knowledge; and to his patron's enthusiastic devotion to the Greek drama may doubtless be traced much of the after-bent of Metastasio's own poetical tastes. By the early death of Gravina, Metastasio was placed in possession of considerable property. In 1724 he published one of his most celebrated dramas, *La Didone*, which, with *Il Catone* and *Il Siroe*, conferred on the poet a European name. In 1730 Metastasio accepted the post of poet-laureate to the imperial court of Vienna. During his sojourn in Vienna, Metastasio composed his *Giuseppe Riconoscinto*, *Il Demofonte*, and the *Olimpiade*. He died at Vienna in 1782. Metastasio was distinguished for the generosity, integrity, and candor of his nature, the sincerity of his friendships, and the disinterested warmth of his sentiments. His works are innumerable, embracing 63 dramas, 48 cantatas, besides a vast number of elegies, canzonette, sonnets, and translations. They enjoy unexampled popularity among all grades of his countrymen; in their pure classical subjects and forms

the educated student finds instruction and delight; while their facile musical grace and verbal simplicity adapt them to the popular appreciation of the artless beauties of poetry. The best editions of Metastasio are those of Turin (1757, 14 vols.); Paris (1755, 12 vols.); Paris (1780, 12 vols., large 8vo); Genoa (1802, 6 thick vols.); Mantua (1816–20, 20 vols.).

METAS'TASIS, a change in the seat of a disease from one part of the body to another. Rheumatism and gout are examples. Muscular rheumatism is more or less movable, changing from one set of muscles to another. Arthritic rheumatism is more liable to change persistently from one joint to another, or it may pass to an analogous tissue in another kind of organ, as to the serous membranes of the heart, or pericardium, constituting cardiac rheumatism, a dangerous affection. Gout is well known for its flights from one point to another. Inflammation of the parotid gland, or mumps (q.v.) is also a metastatic affection. The causes of metastasis are rather obscure, but they are undoubtedly intimately connected with the nervous system, whose terminal fibers, ending as they do in the cellular elements of the tissues, influence, in a great measure, their pathological as well as physiological action.

METAYER (Ital. *metà*, Fr. *moitié*, half), in French, is the cultivator of a *metairie*, or farm, the tenant of which gives the landlord a portion of the produce as his rent. In some of the older French dictionaries, such as that of Trevoux, the word is said to apply to any kind of farmer, but in the oldest dictionary of French and English, Cotgrave's, the word is thus interpreted: "Properly one that takes ground, to the halves, or binds himself by contract to answer unto him of whom he holds them half, or a great part of the profits thereof." The term has lately got a meaning in political economy on account of some eminent writers having raised the question whether this arrangement between landlord and tenant is not so much more advantageous than any other, both to the parties immediately concerned and to the public at large, that it ought to be specially encouraged. Sismondi appears to have been the first to open this wide view of the influence of the practice, and he has given a chapter to its consideration in his Political Economy (b. iii. chap. 5). He says what cannot be denied, that such an arrangement was a great improvement on mere serfdom, which gave the cultivator no interest in the produce of his industry. But in giving the reasons for his admiration of the system as one which provides in the general case for the wants of the peasant while relieving him of all anxiety about markets and prices, he admits that a metayer peasantry never advance beyond the humble, happy, and contented lot which immediately falls to them. It is a system, therefore, inconsistent with the application of large capital to cultivation, and consequently with the extraction of the highest value which the soil can yield. A tenant will hesitate to lay £50 worth of guano on his fields if half the additional crop it will bring goes to his landlord. To those who maintain that the moral effect of the system is beneficial, this will be no argument against it, but to the political economist it is an argument against the practicability of the system in a rich money-making agricultural country. Where there is an enterprising peasantry without capital it is a valuable resource; a great portion of the valuable agricultural districts of Scotland were thus brought into cultivation by improvers whose rent was a portion of the crop. But while these very districts in a great measure owe their present prosperity and the existence of a set of capitalist-farmers to such a system of cultivation pursued with more energy than M. Sismondi considers natural to it, there is no doubt that the substitution of such an arrangement for money-rent would now be a very serious waste.

METCALFE, a co. in s. Kentucky, drained by the south fork of Green river, which rises within its limits; 370 sq.m.; pop. '80, 9,423—9,414 of American birth, 1036 colored. Its surface is varied, and largely covered with timber. Its soil is fertile, producing large quantities of tobacco, and suited to the production of wool, sweet-potatoes, the products of the dairy, flax, maple sugar, sorghum, honey, fruit, and every kind of grain. Stock-raising receives much attention, and its grist-mills are run by steam. Seat of justice, Edmonton.

METCALFE, FREDERICK, b. England, 1817; a distinguished scholar and educator, having pursued the regular course of study at the university of Cambridge, graduated in 1838, and was elected fellow of Lincoln college, Oxford. In 1848 he accepted the position of principal of the Brighton college, an institution founded in 1847 for the sons of noblemen. In 1844 he published a translation of prof. A. Becker's *Gallus*, or *Roman Scenes of the Times of Augustus*, with notes and exercises, considered of great historical value; 2d edition, 1853. In 1845 a translation of Becker's *Charicles*, a tale illustrative of private life among the ancient Greeks, with notes and exercises. He was the author of *History of German Literature*, based on the German work of Vilmar, 1858; other works are *The Oxonian in Norway*, or notes of excursions in that country, 1856, *The Oxonian in Thelemarker*, 1858, *The Oxonian in Iceland*, 1861, and an adaptation, for use in schools, of Whittaker's edition of Dr. Charles Anthon's *Virgil*, 1846.

METELLUS, the name of a Roman family of the plebeian gens Cæcilia, which rose to be one of the first families of the Roman nobility.—One of the most distinguished members of the family was QUINTUS CÆCILIUS METELLUS MACEDONICUS, who received his surname from his victory over Andriscus, an aspirant to the throne of Macedonia (148 B.C.). His life was considered by ancient writers an example of the greatest felicity.

He died 115 B.C.—Another was QUINTUS CÆCILIUS METELLUS NUMIDICUS, who twice defeated Jugurtha in Numidia (109 B.C.), and was celebrated for his integrity of character, but was superseded in his command by Marius. His son, QUINTUS CÆCILIUS METELLUS, surnamed *Pius*, joined Sulla in 83 B.C., but sought to moderate the severity of his proscriptions. He, too, bore a distinguished character for virtue.—QUINTUS CÆCILIUS METELLUS CRETICUS conquered Crete, and reduced it to a Roman province (67 B.C.).—QUINTUS CÆCILIUS METELLUS PIUS SCIPIO, sometimes called QUINTUS SCIPIO, and sometimes SCIPIO METELLUS, was a son of Publius Cornelius Scipio, who was adopted by one of the Metelli, and became the father-in-law of Pompey, and his zealous partisan. He commanded under him at Pharsalus, maintained war on his behalf for some time in Africa; and after the battle of Thapsus (46 B.C.), died by his own hand.

METEMPSYCHO'SIS. See TRANSMIGRATION OF SOULS.

METEOROL'OGY (Gr. *metéōra*, meteors, or atmospheric phenomena) was originally applied to the consideration of all appearances in the sky, both astronomical and atmospherical; but the term is now confined to that department of natural philosophy which treats of the phenomena of the atmosphere as regards weather and climate. The leading points of this wide subject will be found under such heads as AËROLITES, ATMOSPHERE, BAROMETER, BOILING, CLOUDS, DEW, ELECTRICITY, EVAPORATION, FOG, HAILSTONES, HALOS, HOAR-FROST, LIGHTNING, MAGNETISM, RAIN, SNOW, STORMS, etc. We confine ourselves here to a historical sketch of the science.

Owing to the complexity of the phenomena, meteorology is the most difficult and involved of the sciences, and seems, indeed, at first sight, almost incapable of being reduced to a science at all. On this account, the only procedure admissible in the first place is long and patient observation, and a faithful recording of facts.

From the nature of the subjects which make up the science, it may be inferred that they occupied men's minds from a remote antiquity. The splendid and ever-varying panorama of the sky, and the changes of temperature through the days and the seasons, with all the other elements constituting the weather, and thus powerfully affecting the necessities and comfort of man, are of a nature well fitted to arrest his attention. From the time spent in the open air in the early ages, and from the imperfect protection afforded against the inclemency of the seasons, those appearances which experience proved to precede a change of weather would be eagerly recorded and handed down. In this way, many most valuable facts were ascertained and passed current from hand to hand; and, perhaps, there is no science of which more of the leading facts and inferences have been from so early a period incorporated into popular language.

Aristotle was the first who collected, in his work *On Meteors*, the current prognostics of the weather. Some of these were derived from the Egyptians, who had studied the science as a branch of astronomy, while a considerable number were the result of his own observation, and bear the mark of his singularly acute and reflective mind. The next writer who took up the subject was Theophrastus, one of Aristotle's pupils, who classified the opinions commonly received regarding the weather under four heads, viz., the prognostics of rain, of wind, of storm, and of fine weather. The subject was discussed purely in its popular and practical bearings, and no attempt was made to explain phenomena whose occurrence appeared so irregular and capricious. Cicero, Virgil, and a few other writers also wrote on the subject without making any substantial accessions to our knowledge; indeed, the treatise of Theophrastus contains nearly all that was known down to comparatively recent times. Partial explanations were attempted by Aristotle and Lucretius, but as they wanted the elements necessary for such an inquiry, being all but totally ignorant of every department of physical science, their explanations were necessarily vague, and often ridiculous and absurd.

In this dormant condition meteorology remained for ages, and no progress was made till proper instruments were invented for making real observations with regard to the temperature, the pressure, the humidity, and the electricity of the air. The discovery of the weight or pressure of the atmosphere made by Torricelli in 1643 was undoubtedly the first step in the progress of meteorology to the rank of a science. This memorable discovery disclosed what was passing in the more elevated regions of the atmosphere, and thus the elevations and depressions of the barometric column largely extended our knowledge of this subtle element. See BAROMETER.

The invention and gradual perfecting of the thermometer (q.v.) in the same century, formed another capital step; as without it nothing could be known beyond vague impressions regarding temperature, the most important of all the elements of climate. This great invention soon bore excellent fruit. Fahrenheit constructed small and portable thermometers, which, being carried by medical men and travelers over every part of the world, furnished observations of the most valuable description—the comparative temperature of different countries became known, and the exaggerated accounts of travelers with regard to extreme heat and cold were reduced to their proper meaning. Scarcely less important was the introduction of the hygrometer (q.v.), first systematically used by De Saussure (died 1799), and afterwards improved by Dalton, Daniell, and August. From the period of the invention of these instruments, the number of meteorological observers greatly increased, and a large body of well-authenticated facts of the utmost value was collected. The climates of particular parts of the earth were determined, and

the science made great and rapid advances by the investigations undertaken by distinguished philosophers into the laws which regulate the changes of the atmospheric phenomena.

The theory of the trade-winds was first propounded by George Hadley in the *Philosophical Transactions* for 1735; and it may be mentioned as a remarkable fact that for about half a century it remained quite unnoticed, when it was independently arrived at by Dalton, and published in his essays.

The publication of Dalton's Meteorological Essays, in 1793, marks an epoch in meteorology. It is the first instance of the principles of philosophy being brought to bear on the explanation of the intricate phenomena of the atmosphere. The idea that vapor is an independent elastic fluid, and that all elastic fluids, whether alone or mixed, exist independently; the great principles of motion of the atmosphere; the theory of winds, their effect on the barometer, and their relation to the temperature and rain; observations on the height of clouds, on thunder, and on meteors; and the relations of magnetism and the aurora borealis, are some of the important questions discussed in these remarkable essays, with an acuteness, a fullness, and a breadth of view that leave little to be desired.

One of the most interesting and truthful subjects of inquiry that engaged the attention of meteorologists was *dew*. The observations on this subject were first collected and reduced to a perfect theory by Dr. Wells. See DEW.

In 1823 Daniell published his *Meteorological Essays and Observations*, which, while adding largely to our knowledge in almost every department of the subject, are chiefly valuable as bearing on the hygrometry of the atmosphere. Though the practical advantages which he anticipated would flow from it have not been realized, yet this difficult and still obscure department of meteorology stands indebted to him more than to any other philosopher. The law of the diffusion of vapor through the air, its influence on the barometric pressure, and its relations to the other constituents of the atmosphere are among the least satisfactorily determined questions in meteorology. Since this element is so important as an indicator of storms and other changes of the weather, and since so much remains still to be achieved, it is to be hoped that it will soon be more thoroughly investigated. A most important addition has lately been made to our knowledge of the vapor of the atmosphere by professor Tyndall, in his experiments on radiant heat, especially as regards the gases. The vapor of water is there shown to exert extraordinary energy as a radiant and absorbent of heat; and hence the vapor dissolved in the air acts the part of a covering or protection to the earth. As it is, to some extent, impervious to solar and terrestrial radiation, it follows that if the air were quite drained of its moisture, the extremes of heat and cold would be so intense and insufferable that all life would instantly perish, there being no screen shielding the earth from the scorching glare of the sun by day and from the equally scorching and blighting effects of its own radiation by night. It is to be expected that this great discovery will soon throw light on many questions of meteorology.

Electrical observations have been, of all meteorological observations, perhaps the least productive, partly owing to their scantiness, from the expense and trouble attending them, and partly, no doubt, to the free and bad use made of the name of electricity by crude theorists in explaining phenomena of which it would have been wiser to have confessed their ignorance. But the brilliant discoveries which have recently been made on the mutual relations of heat, motion, electricity, magnetism, and the other forces of matter, lead us to indulge the hope that the application of these results to meteorology will be attended with discoveries equally brilliant and important.

Humboldt's treatise on *Isothermal Lines* (1817) constitutes a notable epoch in experimental meteorology. Dové has since continued the investigation, and in his splendid work, *On the Distribution of Heat on the Surface of the Globe*, has given charts of the world, showing the temperature for each month and for the year, and also charts of abnormal temperatures. It is scarcely possible to overestimate the value of this work, for though, to a considerable extent, the lines are hypothetical, there can be no doubt that a close approximation to the march of mean temperature and its distribution over the earth through the year has been arrived at. The idea has been carried out with greater fullness of detail by the United States government in the beautiful and elaborate series of charts of temperature and rainfall given in the *Army Meteorological Register* for 1855. In these charts the temperature and rainfall in the different seasons for every part of the United States, deduced from accurate observations, may be seen at a glance. Buchan has published isothermals for the British isles, Mohn for Norway, and Blandford for Hindustan; and isothermals for the sea have been published by the admiralty.

The establishment of meteorological societies during the last twenty years must also be commemorated as contributing in a high degree to the solid advancement of the science which, more than any other, must depend on extensive and carefully conducted observation. In this respect, the United States stand pre-eminent, the observers there numbering nearly 800. Great Britain is also well represented in the English and Scottish societies, which together number above 200 observers. In France, Germany, Russia, etc., the science is also being widely cultivated. Owing to the disastrous flooding of the Rhone, an inquiry has been carried on for several years, having for its object the determination of those causes which affect the rainfall in the basins of the Rhone and Saône. Observers in Germany and Great Britain have been secured to co-operate with

the French observers, and under the management of a commission it may be expected that important conclusions respecting the rainfall and the progress of storms will be arrived at, and means devised to avert the calamity of these great floods by timely warning being given of their approach.

A special object of meteorological societies is to ascertain the degrees of heat, cold, and moisture in various localities, and the usual periods of their occurrence, together with their effects on the health of the people and upon the different agricultural productions; and by searching into the laws by which the growth of such products is regulated the agriculturists may be enabled to judge with some degree of certainty whether any given article can be profitably cultivated.

But perhaps none of the arts have benefited to so large an extent by the labors of meteorologists, as navigation. The knowledge thus acquired of the prevailing winds over the different parts of the earth during the different seasons of the year—and the regions of storms and calms—and the laws of storms, have both saved innumerable lives, and by pointing out the most expeditious routes to be followed, shortened voyages to a remarkable degree. In connection with this, the name of Captain Maury (q. v.) deserves special commendation for the signal service he has rendered to navigation.

Another fruit of the multiplication of meteorological stations is the prediction of storms and "forecasts" of the weather, which have been carried on in the United States, and commenced with ability and success by Admiral Fitzroy in England. These "forecasts" are based on telegrams which are received every morning from above forty selected stations in Great Britain and Ireland, and on the continent, from Haparanda as far south as Lisbon. These telegrams give the exact state of the barometer, thermometer, hygrometer, and rain-gauge, with the direction and force of the wind, and appearance of the sky, at each of these forty stations at eight in the morning. In the event of there being any storm or other atmospheric disturbance at one or more of these places, a full and accurate description of it is thus conveyed to London; and it is thence the duty of the officials there to consider the direction in which the storm is moving, so as to enable them to give warning of its approach by special signals. But in addition to warnings of storms, Fitzroy also issued daily "forecasts" of the weather likely to occur in the different districts of Great Britain for the following two days, and which were in like manner founded on the state of the atmosphere at distant points, keeping in view the atmospheric currents known generally to prevail at that particular time of the year. As the cost of this system was about £2000 annually, a severe test was applied, at the instance of the Treasury, from July 1861 to June 1862, for the purpose of ascertaining whether the expenditure was justified by the success attending it. During the first six months, 413 signals were hoisted, and in 214 cases a storm occurred where a warning was given. It must not be inferred that in the remaining 199 cases there was no storm anywhere; all that was meant was, that no storm occurred at the places where the signal was given; but a storm may have occurred, and probably did occur, in some other part of the country. Now that the system has been longer in use, the signals are given from a better knowledge of the movements of the atmosphere, so that if the test were again applied, the number of failures would be found to be much fewer. Since the barometric depression is in almost all cases spread over a wider area than the storm which accompanies it, and since the storm occasionally passes into the upper regions of the atmosphere, so as to be less felt on the earth's surface at that place, it is obvious that a considerable time must yet elapse before a sufficiently intimate knowledge of the movements of the air be acquired in order to indicate with certainty the particular places where the storm will break out, and where it will not. The problem to be practically worked out is this: Given the telegrams from the stations showing the exact meteorological conditions prevailing over the included area, with indications of a storm approaching in a certain direction, to determine, not the probable area over which the tempest will sweep, but the precise localities which will altogether escape, the places where the storm will rage, and the places where it will not touch the earth, but pass innocuously into the upper regions of the atmosphere; its continuance, its violence, and the particular directions from which the wind will blow at the places visited by the storm while it lasts. Considerable progress has already been made towards the solution of this difficult problem; and if a complete solution be impossible, such an approximation to a solution will doubtless be arrived at as will render it foolhardy to disregard the warnings given.

But these predictions only extend to a few days. Does the present state of the science afford any grounds to hope that prediction for longer periods will yet be attained? Weather-registers extending over long periods give no countenance whatever to the notion, that there are regularly recurring cycles of weather on which prediction may be based. Further, the manner in which good and bad seasons occur in different places with respect to each other, shows clearly that they have little direct immediate dependence on any of the heavenly bodies, but that they depend directly on terrestrial causes. Thus, while the summer of 1861 was almost unprecedentedly wet and cold in Scotland, the same summer was hot and dry to a degree equally unprecedented on the continent of Europe, and particularly in Italy; and such examples may be multiplied almost *ad infinitum*

The assumption that the equatorial and polar currents of wind at any locality may

ultimately balance each other, would appear, from recent observation, to give some ground for prediction extending over considerable intervals. Thus, a wet summer was predicted for Britain in 1862, from the circumstance of a most unusual prevalence of e. winds in the spring of that year. An almost incessant continuance of s.w. winds followed, which discharged themselves in deluges of rain, clouded skies, and a consequent low temperature. As these s.w. winds prevailed till the spring of 1863, less s.w. wind was looked for during the summer, which was thus expected to be fine and warm—a prediction which was realized. This prediction holds in about three cases out of four.

The following are a few standard works on Meteorology, in addition to those already referred to: L. F. Kaemtz's *Meteorology*, translated from the German (Lond. 1845); Dr. Ernst Erhard Schmid's *Lehrbuch der Meteorologie* (Leipz. 1860); Professor Espy's *Fourth Report on Meteorology* (Washington, 1857); Drew's *Meteorology*, a useful handbook (Lond. 2d ed. 1860); Herschel's *Meteorology* (1861); D. P. Thomson's *Introduction to Meteorology* (1849); Buchan's *Handy Book of Meteorology* (1868); Loomis' *Treatise on Meteorology* (1868).

METEOROLOGY (*ante*). The advancement in meteorological science in recent years has been mainly in the direction of the application of the laws of storms to practical use, in foretelling perturbations in the interest of commerce and navigation. In this direction great progress has been made, as to which, see SIGNAL SERVICE OF THE UNITED STATES. From the accumulation of statistics and history in this department, the following information concerning the government and private machinery for meteorological observation in different countries, is compiled: The first international meteorological congress occurred at Vienna, in September, 1873, when eighteen governments were represented by delegates officially appointed. This congress had been preceded by the Brussels maritime conference in 1853, the conference at Leipsic in 1872, and the meeting at Bordeaux in the latter year. The object of these meetings was to establish an international and reciprocal meteorological system for the benefit of the countries participating, and indeed of the civilized world. This object was so far effected that a strong interest was awakened in the subject on the part of the different governments, and a permanent committee was appointed which holds annual meetings. Among those—and chief among them—who have labored unselfishly to awaken interest in the study of the laws of storms should be ever remembered the names of Redfield, Espy, Fitzroy, Reid, and Maury; besides Humboldt, Dove, Ritter, Sabine, Kämtz, and Herschel, who preceded them in the same field. Through the efforts of some of these meteorologists the information gained by the experience of navigators has been collated and analyzed, and a very complete knowledge of ocean meteorology has been obtained; while the storms of the Indian ocean and the law of cyclones have been studied by Meldrum, with the assistance of the Mauritius meteorological society, to the great advantage of the world's information on the science. The first effort in the direction of making regular meteorological observations in the United States was made in 1818 at military posts, under the direction of surgeon-general Lovell, and as these are still continued, they form the oldest unbroken national series of the kind in existence. Certain of the states afterwards entertained the idea, and New York from 1825–1863, Pennsylvania 1836–1842, Ohio in 1842, and Illinois in 1856, formed organizations for the same purpose, but which have all been discontinued. Besides the information obtained from these sources, there has been much service performed in a desultory way by the Franklin institute, Smithsonian institution, state boards of health, agricultural and geological societies, and other organizations, as well as by special expeditions. Half a century ago, James P. Espy, an enthusiast, as well as a clear-headed observer, devoted himself to the study of meteorology, and by lectures and writings sought to popularize the subject. In 1836 he wrote a memoir which gained for him the Magellanic premium awarded by the American philosophical society; and in 1841 appeared his *Philosophy of Storms*, which publication completely revolutionized the sum of scientific opinion on the subject. The following year he was appointed meteorologist in the surgeon-general's office of the war department, and having already begun the practice of weather-mapping, he continued it daily. His first published report in 1843 is acknowledged to have been "by far the most important contribution to our knowledge of storms that had then been made by any government in the world." This was in 1843; and on Mr. Espy being transferred to the navy department, he published two other reports, dated 1849 and 1851 respectively. His fourth report was made to the U. S. senate in 1854. Mr. Espy died in 1857, at the age of 72, having devoted forty years of his life to meteorological study and investigation. Thus much is here given concerning this remarkable man, because of the influence which he exerted, and which doubtless gave the timely impetus that resulted in placing the United States in the front rank among those nations that have given its due importance to the study of meteorology. This study, with its accompanying record of observation, is prosecuted in the United States at the following points, 1. The independent observatories at Cambridge, Washington, Albany, and New York Central Park. 2. The state weather services of Iowa, receiving reports from 80 observers; Missouri, with 100 observers; and Nebraska; which all publish monthly reviews and annual reports. 3. The state boards of health for Michigan, New Jersey, etc. 4. The state boards of agriculture for Illinois,

Ohio, etc. 5. The state schools of agriculture at Lansing, Mich., and Boston and Amherst, Mass. 6. The Central Pacific railroad company land office, which receives reports from 120 stations. 7. The army engineer bureau lake survey, which has maintained 8 or 10 important stations on the lakes. 8. The geological and geographical surveys of western territories (Wheeler's, Hayden's, Powell's, etc.), and the U. S. coast survey. 9. The hydrographic office of the navy department, which maintains an hourly series of observations on every vessel in commission, and at all naval stations, and publishes important charts relating to ocean meteorology. 10. The army surgeon-general's office, the Smithsonian Institution, and the agricultural department. Of these three the first continues its observations and the second its publications, although most of the data are transferred to the army signal office. 11. The army signal office, division of reports and telegrams for the benefit of commerce and agriculture. This last-named organization, whose meteorological work began by order of congress in February, 1870, far exceeds all other similar organizations in the world. It maintains 166 regular, 28 sunset, 30 river, and about 10 temporary West India stations. It also receives reports from 95 army-post surgeons, 300 voluntary civilian or Smithsonian observers, 120 railroad employés (mostly in California), about 150 observers through the state organizations in Iowa, Missouri, and Kansas, about 40 vessels and stations of the navy, about 20 merchant vessels through their respective owners, and about 390 foreign stations through the central offices of their respective countries. Rainfall reports are thus obtained from about 870 stations within the United States. It publishes a tri-weekly bulletin and map, with predictions based on tri-daily telegraphic reports from 35 additional stations; displays cautionary storm-signals at about 80 coast stations; bulletins the state of the rivers and coming floods; distributes farmers' bulletins or predictions to over 6,000 post-offices; furnishes special predictions to several hundred railroad telegraph offices; and publishes a weekly weather chronicle, a monthly weather review with charts of American storms, temperature, rain, and ocean storms, and an annual report. It also prints for exchange a daily bulletin of international simultaneous observations, with daily chart of the winds, temperature, and pressure throughout the northern hemisphere. This is based on about 700 reports from land and sea contributed by all nations, and made simultaneously with those that are made at 7 h. 35 m. A.M. at Washington, or 12 h. 43 m. P.M. at Greenwich. In the prosecution of its meteorological work and in order to carry out the system of frontier defenses, and in coöperation with the life-saving service on the United States coast, the signal service also builds and maintains lines of telegraph, of which it now controls about 3,000 m. on the Atlantic coast and in the s.w. and n.w. territories. The service employs the whole time of about 15 officers and 475 men, and a portion of the time of about 150 others. The meteorological service of foreign countries is now sustained as follows (1878): West Indies.—Numerous stations are supported in these islands by the respective home governments. The U. S. signal service maintains about 10 stations during the hurricane season. The principal independent stations are at Havana, Cuba; Kingston, Jamaica; and in Barbadoes and Porto Rico. Great Britain.—The meteorological committee of the royal society have charge of the meteorological work, with office in London. There are 7 stations properly equipped, receiving telegraphic reports from 29 British stations, and publishing daily weather-maps, bulletins, storm-warnings and signals, quarterly and annual reports, etc. It receives observations from several hundred vessels at sea, and from about 80 voluntary observers on land, besides minor stations. The medical department of the army also maintains observers at the forts throughout the British colonies, some of which report to the London office. The royal engineers and ordnance survey offices also maintain several stations. The different meteorological societies of the empire publish memoirs which contain reports from different stations. Wind and current charts and pilot charts are published by the hydrographer to the admiralty, based on observations made on shipboard. France.—Observations are maintained since 1878 by the bureau centrale de météorologie, the departments of France preserving their separate organizations. The meteorological association of France has its own stations. The bureau centrale publishes daily bulletins, weather-charts and storm-warnings, and in conjunction with the association scientifique de France, issues the annual volumes of the Atlas météorologique de France. The meteorological association corresponds with about 50 observers in different parts of the world. Germany.—The headquarters of the meteorological system is in Hamburg, and maintains about 40 stations (27 telegraphic), publishes daily weather-maps and predictions, storm-warnings, and monthly weather reviews, and receives a large number of logs from German vessels. The German forest commission maintains several stations for meteorological observations. There are subordinate organizations with stations in Bavaria, Baden, Prussia, Saxony, and Würtemberg; with headquarters respectively at Munich, Carlsruhe, Berlin, Leipsic, and Stuttgart. The whole number of well-equipped stations in Germany is about 200, and slowly increasing. Russia.—Observations are made at most of the universities, and published in full independently at Dorpat, Helsingfors, Tiflis, and Moscow. The central meteorological office is at St. Petersburg, and receives reports from 130 well-equipped (50 telegraphic), 220 rainfall, and 310 thunder-storm stations, distributed throughout the Russian possessions, abstracts of which are published annually. The central office publishes a daily telegraphic bulletin, displays storm-signals, and publishes volumes of memoirs and investigations. The academy of sciences and the geographical society aid

in the advancement of the study. Italy.—Numerous independent meteorological organizations exist, the Italian alpine club publishing observations made at about 70 stations; and the observatories at Moncalieri, Turin, Pesaro, Venice, Naples, and Rome, issuing their own observations. A general Italian meteorological association was organized in 1877. Spain.—The central meteorological office is at Madrid, and receives reports from 30 home stations including Portugal (26 telegraphic), all of which are published annually. A daily telegraph bulletin is published, and storm-warnings are issued when sent from Paris or London. In the Spanish colonies, the most important stations are at Manila and Porto Rico. Portugal.—The meteorological observatory at Lisbon receives reports from 5 home and as many colonial stations, and from the vessels of the Portuguese navy. The observations made at Coimbra and Lisbon are published in full. It publishes a daily telegraphic bulletin (10 telegraphic stations), and repeats the storm-warnings sent from London and Paris. Belgium.—The royal observatory at Brussels receives reports by telegraph from 4 stations, and publishes daily weather-maps and predictions, annual volumes of its own detailed observations, and of 4 Belgic and 4 Dutch international and of 35 Belgic climatologic stations; also an *annuaire*. Austria and Hungary.—The central meteorological institution at Vienna has charge of all observations made in the empire, and receives reports from about 275 stations (26 by telegraph, daily); it publishes a daily bulletin, storm-warning signals, and annual volume of observations. In Bohemia there are about 50 rainfall stations, and a similar system is arranged for Styria. The hydrographic office has charge of marine meteorology, with a school at Trieste and observatory at Pola. There are also independent observatories at Cracow, Prague, and Vienna, which publish their own observations. The central magnetic and meteorological institution for Hungary is at Buda-Pesth, and was founded in 1870. It publishes annually reports from about 100 stations, mostly well-equipped. A summary for 32 stations in Carinthia is published monthly at Klagenfurth. Norway.—The royal meteorological institute at Christiania receives reports from 10 full stations (7 telegraphic), 10 lighthouses, and a large number of minor stations, and logs of vessels. A telegraphic daily bulletin has been published since 1861. The meteorological observatory at Christiania was founded in 1836. Sweden.—About 30 stations (9 telegraphic) and several naval vessels report to the central meteorological institute at Stockholm, which publishes a daily telegraphic bulletin and annual volumes. The Lund and Upsala observatories publish their own observations separately. Switzerland.—The central institute for Swiss meteorology has its seat at Zürich, and publishes in full the observations at about 15 stations. The total number of reporting stations is about 80. The observatories at Bern and Geneva publish their own work in detail. The central office is maintained by the Swiss association and not by the state. There are stations in Africa—in the Transvaal, at Zanzibar, Natal, and other places, besides those in the large colonies; in Algeria observations are made under the direction of the military authorities, a daily weather bulletin and chart are published, and about 20 observing stations are maintained; at Cape Colony there is a meteorological commission instituted in 1861 and reorganized in 1874. It receives reports from 30 or 40 stations: the royal observatory at Cape Town maintains an independent series of observations. Australia.—The several provincial governments maintain systems at Queensland, 5 telegraphic stations; New South Wales, 190 stations (35 telegraphic); South Australia, 110 stations (5 telegraphic); Victoria, about 40 stations (27 telegraphic). The central offices of these are at Brisbane, Sydney, Adelaide, and Melbourne; there are also individual stations at Melbourne, Windsor, and Hobart Town, which publish their own observations. Ceylon.—About 30 stations report to the surveyor-general at Colombo, and the reports are partially published. China.—Instruments for equipping about 20 stations were obtained in 1874, but we have no reports. Egypt.—The principal service is that of the lighthouse keepers, though observations are made at the observatories near Cairo and at Alexandria, and on the Suez canal. Japan.—Observations are made at the imperial observatory and at the imperial colleges of mining and engineering, and a system of records is preserved by the lighthouse keepers. Reports will be soon forthcoming also from about 20 equipped stations. New Zealand.—About 20 meteorological stations are maintained. Philippine islands.—The observatory of the Jesuit college at Manila, in Luzon, is the only station permanently occupied, and publishes annually its observations. Netherlands.—The central meteorological institute maintains 14 full and 23 minor stations (4 telegraphic), issues storm-warnings, and publishes annual volumes. There are a large number of rainfall stations. Its most important colonial station is at Batavia. Denmark.—The royal Danish meteorological institute receives reports from 12 principal (8 by telegraph) and 70 minor stations in Denmark, also 5 from Iceland and 5 from Greenland. It publishes daily bulletins, annual volumes, and a daily chart of the Atlantic ocean. Finland.—The scientific association at Helsingfors maintains 22 stations and publishes its own results. The observatory at Helsingfors is independently maintained. India.—The provinces of Bengal, the Punjab, the Northwest, Madras, etc., maintain independent systems of meteorological reports. In 1875 a general meteorological office was established in the department of revenue, agriculture, and commerce. About 300 stations report by mail to the head of this office daily, and about 50 by telegraph. It publishes daily, weekly, and monthly bulletins, and special storm-warnings. Chili.—An extensive system of observations is maintained at Santiago,

receiving regular reports from 13 or more stations. Costa Rica.—There is a central office for statistics and meteorological observations, and a station at the capital. Argentine Republic.—The meteorological office is attached to the astronomical observatory, about 30 voluntary observers reporting. There are also scattered stations in South America, at Quito, Lima, Rio Janeiro, Georgetown, Surinam, and Trinidad. Mexico.—A central office in the capital publishes a daily telegraphic bulletin from about 30 stations, and monthly summaries. Canada and Newfoundland.—The Canadian meteorological office is under the minister of the marine, who receives reports from about 20 first-class (14 by telegraph) and about 140 minor stations, distributed throughout the British possessions. It issues daily weather predictions and storm-warnings, and displays storm-signals. Turkey.—The central observatory at Constantinople receives reports from about 30 stations, publishes a daily telegraphic bulletin of 17 stations, and its own observations in full, and issues storm-warnings. Syria.—Observations are maintained at the Syrian college (Protestant mission) in Beyrout, and a more extended system is understood to have been recently organized under the British and American "Palestine Exploration" societies. Mauritius.—The meteorological association of Mauritius was established in the year 1851. It has published irregularly monthly notices, maintains a large number of rainfall stations, and gives warning of such storms as are evidently about to make themselves felt in the vicinity of the island. Beyond this there is no mention of any meteorological work progressing here.

METEORS. The whole subject of meteors was treated in the body of the work under the head of AËROLITES. The subject, however, has since occupied a great deal of attention, and there is at present a tendency on the part of astronomers and physicists to separate that class of meteors known as "shooting-stars" from the group of *meteorolites* (which includes *aëro-siderites*, or masses of meteoric iron; *siderolites*, which are conglomerates of iron and stone; and *aërolites*, which are wholly of stone), on the grounds that the most prominent appearances of the former are *periodic*, while the latter seem to occur at irregular intervals, and that the former have hitherto not been *proved* to leave any traces of their visit on the earth's surface. We are, however, hardly as yet in a position to decide as to the similarity or dissimilarity of the two classes of bodies.

Popular interest has been largely aroused respecting "shooting-stars," by reason of the brilliant display of them which took place on the night of Nov. 13, 1866. This "star-shower," the grandest that has ever been observed in Britain, was confidently predicted, from the occurrence of a similar shower at the corresponding date in 1799, 1833, and 1834; and the extremely favorable state of the atmosphere rewarded those who were on the watch with a complete view of one of nature's most magnificent displays. The shower commenced about 11½ P.M., with the appearance at brief intervals of single meteors; then they came in twos and threes, steadily and rapidly increasing in number till 1h. 13m. A.M. on Nov. 14, when no fewer than 57 appeared in one minute. From this time the intensity of the shower diminished gradually, wholly ceasing about 4 A.M. The total number of meteors which at that time came within the limits of the earth's atmosphere was estimated at about 240,000, and the number seen at each of the several observatories in Britain averaged nearly 6,000. This star-shower, like those of 1833 and 1834, seemed to proceed from the region of the heavens marked by the stars ζ and γ in the constellation Leo; and it has been shown by astronomers that this was the point towards which the earth in her orbit was moving at the time; consequently, she had either overtaken the meteoric shower, or had "met" it proceeding in a contrary direction. The meteors on that occasion presented the usual variety of color, size, and duration; the great majority were white, with a bluish or yellowish tinge; a considerable number were red and orange; and a few were blue; many surpassed the fixed stars in luster, and some were even brighter than Venus (the most brilliant planet as seen from the earth) at her maximum. Most of the meteors left trains of vivid green light 5° to 15° in length, which marked their course through the heavens, and endured for 3″ on an average, then becoming dissipated; though some of the trains were almost 40° in length, and remained in sight for several minutes. Prof. Airy observed that the direction of the meteors' flight was little influenced by the earth's attraction.

On the morning of Nov. 14, 1867, a star-shower equal in magnitude to that of 1866 was observed in France and America, but was almost wholly invisible in Britain, on account of the cloudy state of the atmosphere.

The brilliant display of 1866 gave a vigorous impulse to the astronomical investigation of shooting-stars, and it is now generally agreed that the November meteors move in an orbit round the sun, inclined at about 7° to that of the earth, and that, in all probability, this orbit forms a ring or belt of innumerable small fragments of matter, distributed with very variable density of grouping along it, thus corresponding so far to the planetoid (q.v.) group between Mars and Jupiter. It is also agreed that the motion of this meteor ring round the sun is retrograde; that the earth's orbit at that point where she is situated on Nov. 13–14 intersects this ring; and that, probably, in 1799, 1833–34, and 1866–67, it is the same group of meteors which has been observed; and the last-mentioned hypothesis has been made the foundation of a calculation of the probable orbit and periodic time of this meteor-ring. The fact that a November star-shower

generally occurs for two years in succession, and then recurs at an interval of 32 or 33 years, seems to indicate that though the earth may pass through the meteor-orbit every year, the meteors are so grouped at intervals along the ring, and their periodic time differs so much from that of the earth, that it requires 32–33 years before this accumulating difference amounts to a complete revolution of either the earth or the ring, and a repetition of the star-shower becomes possible.

Prof. Newton of Yale College, America, who entered into an elaborate investigation of the subject, concluded that the 5 possible periodic times (the earth's being taken as unity) of the meteor-ring were $2 \pm \frac{1}{33.25}$, $1 \pm \frac{1}{33.25}$, and $\frac{1}{33.25}$, and that of these the fourth, $1 - \frac{1}{33.25}$, or 354.62 days, is the actual period of its revolution round the sun, and that, consequently, it has described 34 revolutions while the earth has described 33, the cycle of 34 meteor revolutions differing from 33 years by only 3.17 days; and in accordance with this estimate, he calculated its orbit and the approximate extent (seeing the meteor shower generally occurs in two successive years) of the meteor-group which produces the November showers. His conclusions have, however, been vigorously opposed by other eminent astronomers, such as Prof. Adams (q.v.) and Mr. Alexander Herschel, both of whom hold that the first four of the possible periods given by Prof. Newton are *impossible*, and that the last, $\frac{1}{33.25}$ (i.e., that the meteor-ring makes $\frac{1}{33.25}$ of a solar revolution in a year, and one complete revolution round the sun in 33.25 years), is the correct estimate. If this view be correct, the meteor-group must be so much extended along its ring or orbit as to take more than a year to cross the earth's orbit, and a long time must necessarily elapse before a fair estimate of its extent can be obtained. A periodic time of $33\frac{1}{4}$ years, and an orbit which at the same time approaches so near the sun as to intersect that of the earth, indicate a path of great ellipticity, akin to those of the comets; and the idea of the cometary nature of these meteors derives support from two remarkable facts, the one discovered by Schiaparelli of Milan, that this assumed orbit coincides very nearly with that of the great comet of 1862 (Prof. Adams connects this comet with the August meteors), and the other by C. F. W. Peters of Altona, that it coincides with that of Tempel's comet.

Mr. Alexander Herschel also maintains that the meteors are of recent origin, probably fragments from some of the great luminous bodies, and that though at present assembled in a comparatively dense group, the difference of their relative velocities will have the effect of gradually distributing them all over the meteoric ring, when a November shower will occur every year. Mr. Herschel also carefully observed 20 meteors with the view of calculating their weight, from the rate of their motion and the amount of heat (as shown by their brightness) evolved in the destruction of their velocity, by the resistance of the atmosphere, and found their weight to vary from 30 gr. to $7\frac{1}{2}$ lbs.

The cause of the luminosity of meteors was long a point in dispute, the two chief suppositions being, that the resistance of the atmosphere to a body dashing through it at about 30 miles per second, generated so much heat as to produce ignition; while the other was the action of terrestrial magnetism. The point most strongly urged against the first supposition, by the supporters of the second, was, that the height at which meteors were occasionally seen rendered any action of the atmosphere impossible; but as this objection was founded on the purely hypothetical opinion that the atmosphere did not extend more than about 50 m. from the earth's surface, it was not very cogent. This problem was handled by sir John Herschel in an able paper published in the *Edinburgh Review* (January, 1848), in which he clearly showed that the very high latent heat of the air in the higher and rarer parts of the atmosphere would be sufficient to cause an enormous development of heat in the event of the air being compressed before a body advancing into it with a "planetary" velocity. This opinion is now held by almost all eminent men of science. The enormous heat to which the meteor is thus subject produces incandescence, after which, with more or less facility, according to the nature of the materials of which the meteor is composed, the outer portion becomes liquid, and, by the powerful resistance of the air to the meteor's rapid course, is thrown off in a long stream, forming the tail, which, after rapidly losing its velocity, is precipitated to the earth as a fine dust like volcanic ash; while the meteor, thus rapidly and constantly diminishing as it flies along in its headlong course, either becomes wholly dissipated into "tail," falls to the earth, or makes its way out beyond the limits of the earth's atmosphere, and continues its course. This supposition of exclusive atmospheric agency also gives a plausible explanation of the phenomenon of meteors "bursting," this being caused by the sudden heating and consequent expansion of the outer part, while the interior was still in the state of intense cold acquired while in interplanetary space.

While astronomers and physicists in general have been thus trying to reduce the phenomena of meteors to a system, their chemical brethren have not been idle. Public collections of meteoric bodies have been made at Vienna, the British museum, Paris, Berlin; and private ones by Mr. Greg of Manchester, baron Reichenbach in Austria, and prof. Shepard in America; and opportunities have thus been afforded of determining the nature of their composition.

METER (Gr. measure) is that regulated succession of certain groups of syllables in which poetry (q.v.) is usually written. A greater or less number of groups forms a *line* or *verse* (Lat. a turning), and in modern languages, the verses usually rhyme with one

another; although this is not at all essential to the notion of meter. See RHYME, BLANK VERSE. In the classic languages, meter depended upon the way in which long and short syllables were made to succeed one another. English meter depends, not upon the distinction of long and short, but upon that of *accented* and *unaccented* syllables. Thus, in the lines,

The cu'r|few to'lls | the kne'll | of pa'rt|ing da'y—
Wa'rriors and | chi'efs, should the | sha'ft or the | swo'rd—

the accents occur at regular intervals; and the groups of syllables thus formed constitute each a meter or measure. The groups of long and short syllables composing the meters of classic verse were called *feet*, each foot having a distinctive name. The same names are sometimes applied to English measures, an accented syllable in English being held to be equivalent to a long syllable in Latin or Greek, and an unaccented syllable to a short.

Every meter in English contains one accented syllable, and either one or two unaccented syllables. As the accent may be on the first, second, or third syllable of the group, there thus arise five distinct measures, two dissyllabic and three trisyllabic, as seen in the words—1, fo'lly (corresponding to the classic Trochee); 2, reca'll (Iambus); 3, te'rribly (Dactyle); 4, confu'sion (Amphibrachys); 5, absentee' (Anapæst).

These measures are arranged in *lines* or *verses*, varying in length in different pieces, and often in the same piece. The ending measure of a line is frequently incomplete, or has a supernumerary syllable; and sometimes one measure is substituted for another. All that is necessary is, that some one measure be so predominant as to give a character to the verse. Constant recurrence of the same measure produces monotony. The following lines exemplify the five measures:

1st Measure.

Ri'ch the | trea'sure.
Be'tter|si'xty | yea'rs of | Eu'rope | tha'n a | cy'cle | of Caltha'y.

2d Measure.

Alo'ft | in a'w|ful sta'te.
The pro'p|er stu'd|y of | manki'nd | is ma'n.

3d Measure.

Bi'rd of the | wi'lderness.
Wa'rriors and | chi'efs, should the | sha'ft or the | swo'rd.

4th Measure.

The de'w of | the mo'rning.
O you'ng Loch|inva'r has | come ou't of | the we'st.

5th Measure.

As they ro'ar | on the sho're.
The Assy'rian came do'wn | like a wo'lf | on the fo'ld.

It is instinctively felt that some of these measures are better suited for particular subjects than others. Thus, the first has a brisk, abrupt, energetic character, agreeing well with lively and gay subjects, and also with the intense feeling of such pieces as *Scots wha ha'e*. The second is by far the most usual meter in English poetry; it occurs, in fact, most frequently in the ordinary prose-movement of the language. It is smooth, graceful, and stately; readily adapting itself to easy narrative, and the expression of the gentler feelings, or to the treatment of severe and sublime subjects. The trisyllabic meters, owing to the number of unaccented syllables in them, are rapid in their movement, and calculated to express rushing, bounding, impetuous feelings. They are all less regular than the dissyllabic meters. One of them is frequently substituted for another, as in the opening of Byron's *Bride of Abydos:*

Kno'w ye the | la'nd where the | cy'press and | my'rtle
Are e'mblems | of dee'ds that | are do'ne in | their cli'me;
Where the ra'ge | of the vu'll|ture, the lo've | of the tu'r|tle—

where each of the three lines is in a different meter. In addition to this irregularity, one of the unaccented syllables is often wanting. For instance, in Mrs. Hemans's poem, *The Voice of Spring:*

I co'me, | I co'me ! | ye have ca'lled | me lo'ng;
I co'me | o'er the mou'n|tains with li'ght | and so'ng—

the first line has only one measure of three syllables, although the general character of the versification is trisyllabic.

In a kind of verse introduced by Coleridge, and used occasionally by Byron and others, the unaccented syllables are altogether left out of account, and the versification is made to depend upon having a regular number of accents in the line:

There i's not wi'nd enou'gh to twi'rl
The o'ne red le'af, the la'st of its cla'n,
That da'nces as o'ften as da'nce it ca'n
On the to'pmost twi'g that looks u'p at the sky'.

Here there are four accents in each line, but the number of syllables varies from eight to eleven.

To *scan* a line or group of lines, is to divide it into the measures of which it is composed.

The variety of combinations of meters and rhymes that may be formed is endless; but a few of the more usual forms of English versification have received special names, and these we may briefly notice.

Octosyllabics are verses made up each of four measures of the second kind of meter, and therefore containing eight (*octo*) syllables:

With fru'itless la'bor, Cla'ra bou'nd
And stro've | to sta'nch | the gu'shing wo'und.

Scott's poems are mostly in octosyllabics, and so is *Hudibras*, and many other pieces.

Heroic is a term applied to verses containing *five* meters of the second kind, or ten syllables. Heroics either rhyme in couplets, or are without rhymes, constituting blank verse. Many of the chief narrative and didactic poems in the English language are in rhyming heroics; as those of Chaucer, Dryden, Pope, Cowper, etc. Milton's two great poems, Young's *Night Thoughts*, Thomson's *Seasons*, Cowper's *Task*, Wordsworth's *Excursion*, and many others, are written in blank heroics. Metrical dramas are almost always in blank verse; in which case there is frequently a supernumerary syllable, or even two, at the end of the line:

To be, | or not | to be, | that is | the ques|*tion:*
Whether | 'tis no|bler in | the mind | to suf|*fer.*

In *Elegiacs*, the lines are of the same length and the same measure as in heroics; but the rhymes are alternate, and divide the poem into quatrains or stanzas of four lines, as in Gray's *Elegy*. The Spenserian stanza, popularized by Spenser in the *Fairy Queen*, and much used by Byron, differs from common heroics only in the arrangement of the rhymes, and in concluding with an Alexandrine (q.v.)

Service meter, also called *common meter*, is the form of versification adopted in the metrical Psalms, in many hymns, and other lyrical pieces. From being frequently employed in ballads, this meter is also called *ballad meter*. The first and third lines often rhyme, as well as the second and fourth.

Such are some of the more usual and definite forms of versification. In many poems, especially the more recent ones, so much license is assumed, that it is difficult to trace any regular recurrence or other law determining the changes of meter, or the lengths of the lines; the poet seeks to suit the modulation at every turn to the varying sentiments. But it may be questioned whether much of this refinement of art is not thrown away, upon ordinary readers at least, who, failing to perceive any special suitableness, are inclined to look upon those violent departures from accustomed regularity as the results of caprice.

The kind of verse called *hexameter* is described under its own name.

METER, the basis of the "metrical" or modern French system of weights and measures, and the unit of length. The first suggestion of a change in the previous system dates as far back as the time of Philippe le Bel; but up till 1790 no important change had been effected. On May 8, 1790, proposals were made by the French government to the British, for the meeting of an equal number of members from the academy of sciences and the royal society of London, to determine the length of the simple pendulum vibrating seconds in lat. 45° at the level of the sea, with the view of making this the unit of a new system of measures. The British government, however, did not give this proposal a favorable reception, and it fell to the ground. The French government, impatient to effect a reform, obtained the appointment by the academy of sciences of a commission composed of Borda, Lagrange, Laplace, Monge, and Condorcet, to choose from the following three, the length of the pendulum, of the fourth part of the equator, and of the fourth part of the meridian, the one best fitted for their purpose. The commission decided in favor of the last—resolving that the $\frac{1}{10000000}$ of a quadrant of the meridian (the distance from the equator to the pole, measured as along the surface of still water) be taken for the basis of the new system, and be called a "meter." Delambre and Mechain were immediately charged with the measurement of the meridian between Dunkerque and Barcelona; and the result of their labors was referred to a committee of 20 members, 9 of whom were French, the rest having been deputed by the governments of Holland, Savoy, Denmark, Spain, Tuscany, and the Roman, Cisalpine, Ligurian, and Helvetic republics. By this committee the length of the meter was found to be 443.296 Parisian lines, or 39.3707904 English inches; and standards of it and of the kilogram (see GRAM) were constructed, and deposited among the archives of France, where they still remain. The "metrical system" received legal sanction Nov. 2, 1801. The

following are the multiples and fractions of the meter which are in common use, expressed in English measure:

	English Inches.		English Feet.		English Yards.
Millimeter.....	·0393707904				
Centimeter.....	·393707904				
Decimeter.....	3·93707904				
METER.....	39·3707904	=	3·2808992	=	1·093633
Decameter.....	393·707904	=	32·808992	=	10·93633
Hectometer.....	3937·07904	=	328·08992	=	109·3633
Kilometer.....	39370·7904	=	3280·8992	=	1093·633
Myriameter.....	393707·904	=	32808·992	=	10936·33

From the meter the other principal units of measure and weight are at once derived. See ARE, LITER, GRAM, FRANC.

METER (*ante*). It is probably that in reality the meter of the French archives is not exactly what it was supposed when determined; for the measurement was made upon the supposition that the earth is a regular spheroid having an ellipticity of $\frac{1}{305}$, but it is more probable according to the investigations of gen. Schubert of the Russian army and capt. Clarke of the British ordnance survey that it has three unequal axes, and that the Paris meridian is a very little longer than was computed by the French mathematicians. Their measurements were accurate and the computations upon them, but they measured only 10° of the Paris meridian, and from this deduced the length of the quadrant. It has, however, been computed that if there be an error in the calculation of the French meridian, the prototype meter of the archives is as near as possible the $\frac{1}{10000000}$ part of the quadrant of the meridian which passes through New York.

In consequence of the discussion it was deemed advisable to have a meeting of an international commission to settle the question; 30 independent powers were represented in the commission which assembled at Paris in 1870. Their deliberations were interrupted by the Franco-Prussian war, but were resumed, and resulted in an international convention which established at Paris an international bureau of weights and measures supported by contributions of the participating powers. This bureau was given the care of the prototype standards, and other matters connected with the establishment of the system, and its adoption by other powers. The commission came to the conclusion that the prototype meter, and also the kilogram of the archives, shall be recognized as standards irrespective of any doubts as to their variation from the theoretical value of the Paris meridian. See METRIC SYSTEM.

METER, GAS. See GAS, LIGHTING BY, *ante*.

METHODIST CHURCH, FREE, organized in 1860 at Pekin, N. Y., by a convention of ministers and laymen who were, or had been, members of the Methodist Episcopal church. The various reasons which led to the movement may be summed up in the conviction avowed that the Methodist church had declined from its original simplicity and spirituality. In proof of this it was alleged that many converts had been received without sufficient evidence of repentance and conversion; that worldly practices were tolerated, and engaging in unlawful business was allowed; that the direct witness of the spirit was wanting in many professed Methodists; that power over all sin was not possessed, and that, while entire sanctification was not often even professedly attained, the preaching concerning it was widely divergent and contradictory; that discipline was generally neglected, and by some abandoned; that simplicity in dress had given place to fashionable attire; that free seats had been exchanged for pews; that choirs and organs had broken up congregational praise; that sermons were often read instead of being preached; that very costly church edifices were built and church fairs held; and that oath-bound fellowship in secret societies with irreligious men was tolerated, and even encouraged. In the new organization, bishops were exchanged for general superintendents, to be elected every four years. Quadrennial, annual, quarterly, and district conferences are held, and lay delegates equal in number to the ministers are admitted. The official board is retained. Attendance at class meetings is made a condition of church membership. The preachers in charge nominate, and the classes elect their leaders. The office of presiding elder is retained under the name of district chairman. The articles of faith are the same as those of the Methodist Episcopal church, with two additional: one designed to give emphasis to the doctrine of entire sanctification, and the other to that of endless future rewards and punishment. No persons are admitted to church membership, even on probation, without professing to exercise saving faith in Christ. All members are also required to lay aside all superfluous ornaments of dress, to abstain from the use of intoxicating beverages and of tobacco, and not to join any society requiring an oath, affirmation, or promise of secrecy as a condition of membership. The denomination has made some progress and cherishes the hope of reviving the spirit of primitive Methodism. Their religious services have much of the early warmth and zeal, and congregational singing is universally practiced among them. They have two literary institutions, one at North Chili, N. Y., and the other at Spring Arbor, Mich.: they are conducted in strict accordance with the principles of the denomination, and are making fair progress. The work of the church has been among the poor

and less educated classes, whence chiefly their ministers have been taken. They have not as yet had time or opportunity to build up a denominational literature. A monthly magazine entitled *The Earnest Christian*, and a weekly paper, *The Free Methodist*, are well sustained. Several writers of considerable practical power are highly esteemed within and beyond the denomination. In 1880 they reported 271 itinerant ministers, 328 local preachers, and 12,642 lay members.

METHODIST EPISCOPAL CHURCH (METHODISTS, *ante*) is the name assumed by the Wesleyan Methodists in this country when, after the attainment of national independence, they were organized as a denomination, under rules proposed by John Wesley and adopted by themselves. I. Their doctrine is set forth in 25 articles, formed from the 39 of the church of England by omitting some of them entirely and modifying several of the others, with the design to offer a broad and liberal basis on which the general body of evangelical Christians might unite together in brotherly love. Since 1834 a restrictive rule has removed from the authorities of the church all power to revoke, alter, or change these articles of religion; or to establish any new standards or rules of doctrine contrary to the existing and established doctrinal standards. Their theology is styled by themselves "Arminian," according to what they consider the true import of the name as exhibited in Wesley's doctrinal sermons, *Notes on the New Testament*, and other writings. They adopt his doctrine concerning the "witness of the Spirit" —called by many "assurance"—which he defines as "an inward impression on the soul, whereby the spirit of God immediately and directly witnesses to my spirit that I am a child of God; that Jesus Christ hath loved me and given himself for me; that all my sins are blotted out, and I, even I, am reconciled to God;" and in making this impression Wesley supposes that the Holy Spirit "works upon the soul by his immediate influence, and by a strong, though inexplicable, operation." They generally hold, also, the doctrine which many call "sanctification," or, as Wesley preferred to say, "Christian perfection," and which, as the intelligent among them affirm, negatively "teaches no state, attainable in this life, like that of the angels, or of Adam in paradise, or in which there is an exemption from mistakes, ignorance, infirmities, or temptations;" but positively, "that all saints may, by faith, be so filled with the love of God that all the powers of the soul shall be recovered from the abnormal, perverted, sinful condition, and, together with the outward conduct, be controlled in entire harmony with love." II. The government of the Methodist church is administered in a series of 5 conferences (see CONFERENCES OF THE METHODIST EPISCOPAL CHURCH), in addition to which the leaders' and stewards' meeting, presided over by the pastor and consisting of all the class leaders and stewards of his charge, has important functions connected with the well being and efficiency of each particular church. Evangelization, to extend the work, and supervision, to secure firmly all advantages gained, were at the beginning the two fundamental principles adopted, and they are still diligently maintained. The bishops preside in the conferences; form the districts according to their judgment; appoint the preachers to their fields, permitting none to continue more than three successive years in the same charge, except the presiding elders, whose term may extend to four years, and a few others by special appointment; ordain deacons, elders, and bishops newly elected; travel through the denomination at large, and oversee, in accordance with the rules of the general conference, the spiritual and temporal affairs of the church. They have no particular dioceses, but exercise a joint jurisdiction over the whole church as an itinerant general superintendency. They annually arrange and divide the work among themselves, being responsible for its performance to the general conference, by which they are elected and have their respective residences assigned. As an elder was originally put in charge of a district containing several circuits, he was practically a presiding officer over them. Thus the office of presiding elder was gradually established, and became very useful. It is a sub-episcopate, charged with the duties of oversight and administration in a limited sphere, and makes the ecclesiastical system complete and strong. Their intimate acquaintance in their districts with both pastors and people, and their presidency in the quarterly conferences, enable the presiding elders to give valuable information and counsel to the bishop in arranging the appointments. In doing this, usage makes them the bishop's advisers, but with no actual authority, as the church considers it wise to put the whole responsibility of the appointments on the bishop. Candidates for admission to an annual conference are put on probation for two years in the itinerant work, and are subjected to a thorough examination in prescribed studies; and all who are approved in these trials are ordained deacons; and in two years more, if they complete the required studies, they are ordained as elders. The former administer baptism, solemnize marriage, assist elders in administering the Lord's-supper, and perform all the duties of a traveling preacher; and the latter, in addition to these, administer the Lord's-supper. An elder, deacon, or preacher, may be in charge of a circuit or station with similar functions, except as to the administration of the sacrament. He is the chief executive officer of the local church, charged with the care of its interests according to the requirements of the discipline; and is responsible to the annual conference for his fidelity in performing all his ministerial duties, and for his moral deportment. In subordination to him, class leaders, or sub-pastors, have the special oversight of small portions of the church members whom they meet weekly for "social religious worship, and for instruction,

encouragement, and admonition." Local preachers have a share in the acts of the district and quarterly conferences; and as a lay ministry form a body of self-supporting evangelists more numerous than "the itineracy," which, in many sections of the church and various phases of society, has been very useful. All church buildings and parsonages belong to the local society, and are held by trustees chosen according to the law of the state or territory wherever a particular mode is prescribed, and in other cases by the quarterly conference. Admission to membership in the church is preceded by a probation of six months or longer, as may be determined in particular cases, after which the probationer may be admitted to full membership by complying with the rules prescribed. Members of other evangelical churches, coming with proper testimonials, are received into fellowship without probation. III. PROGRESS OF THE CHURCH. 1. *Pioneer Work.* Methodism, says the historian of the church, presented itself to the new nation as an Episcopal church with all the necessary functions and functionaries of such a body; the only one of Protestant denomination, for the colonial fragments of the English establishment had not yet been reorganized. Led by their bishops, the itinerants went forward in their work, convinced, as they said, "that they were raised up to reform the continent, and to spread scriptural holiness over these lands." Thus, "feeling that their one great work was to save souls," they retained and built up what had already been gained, and, pressing on into new fields, preached wherever hearers could be found. Crossing the Alleghanies they were always with the advance, and were soon found also in New England, Canada, and Nova Scotia. Gowns and prayer-books obstructed their progress and were therefore abandoned. Their system was, in a great degree, constructed to meet the exigencies of the work. Their "class and prayer meetings trained most, if not all, the laity to practical missionary labor, and three or four of them, meeting in any distant part of the earth by the emigrations of these times, were prepared immediately to become the nucleus of a church. The lay or local ministry, borne on by the tide of population, were found almost everywhere, prior to the arrival of regular preachers ready to sustain religious services—the pioneers of the church in every new field." At the end of the century they had increased their 15,000 members to 65,000 and their 80 itinerants to 280, besides many who, physically unequal to the strain of the advance, still did their utmost in easier fields. Bishop Coke's stay in the country was only for limited periods, and after 1787 some of the more arduous portions of the episcopal labors devolved on bishop Asbury alone, who was the chief apostle of the church, consecrating to the work all his powers, making himself an example to all in self-denying toil, giving personal attention to minute details, and visiting much from house to house. One of the first Sunday-schools in America was organized by him in 1786, and four years after the conference ordered Sunday-schools to be generally established for the instruction of "poor children, white and black, in learning and piety." 2. *Denominational Institutions.* (1.) "The Book Concern." In 1788 a "book steward" was appointed, and a borrowed capital of $600 obtained. In 1804 the concern was removed from Philadelphia to New York, and subsequently enlarged the number of its publications, scattering them through the circuits by making all the preachers agents, who, although too busy to write books, could sell them and thus greatly increase the efficiency of their work. In 1818 the *Methodist Magazine* was commenced, and, now called the *Methodist Quarterly Review*, has attained a high rank among religious journals, and has a considerable circulation. In 1820 *Zion's Herald* was commenced by the New England Methodists, and was followed, four years after, by the *Christian Advocate*, the first weekly religious paper published by the book concern. A second publishing house was opened at Cincinnati in 1820; and in 1833 the New York house was removed to larger quarters in Mulberry street, which, in 1836, were consumed by fire at a loss of $250,000. New and better buildings were soon erected on the site, which, having been subsequently enlarged to meet the constantly increasing business, are now used only in the manufacturing of books. The principal office is in the building provided for it and the missionary society, at an expense of a million dollars. (2.) "The Preacher's Fund." From the beginning of their history Methodists have had regard to the wants of their sick and superannuated ministers, and of deceased ministers' destitute families. Funds for their relief have been raised in various ways and have been designated by different names. At present the principal dependence for this purpose is on the contributions of the congregations, which now yield annually $150,000. (3.) "The Missionary Society." The Methodist church itself is justly regarded by its members as one of "the great home-mission enterprises of the North American continent," and for a long time it called for all their resources of men and money. The conference of 1784 ordered a collection to be taken annually in all the principal congregations. While the constant extension of the church was thus a missionary movement, further progress was marked in 1819 by the organization of the missionary society, which, having primary reference to home work, joined with that also the foreign field; in this last its operations, having been gradually extended, now embrace missions in Africa, China, India, Japan, Germany, Switzerland, Denmark, Norway, Sweden, Bulgaria, Italy, Mexico, and South America. Its work is aided by the woman's foreign missionary society, Sunday-school union, tract, freedman's aid, and church-extension societies. (4.) "The educational work began with the church itself." The plan for an academic institute was formed in 1780, the foundation of a building for it being laid at Abington, Md.; and in 1787 Cokesbury college was opened. Its curricu-

lum included "English, Latin, Greek, logic, rhetoric, history, geography, natural philosophy, astronomy, and, when the finances admit of it, Hebrew, French, and German." This building having been burned in 1795, a new one was provided in Baltimore; but in a year this also was lost in the same way. This repeated calamity led bishop Asbury to think that the attention of Methodists should be given to the general establishment of schools from which the high-sounding name of colleges might be withheld. One such school he wished to see in every conference. In 1820 the general conference recommended that each annual conference should establish a school for itself. Several conference schools were soon started, and within 12 years five colleges were founded. These were followed by theological seminaries which, at first, were called biblical institutes. The first projected was located at Concord, N. H., in 1847; and, having been afterwards removed to Boston, became, in 1871, the theological department in the university there. The Garrett biblical institute at Evanston, Ill., founded in 1855, received its name and an endowment of $300,000 from a lady of Chicago. The Drew theological seminary at Madison, N. J. (see MADISON), was established by the gift of Daniel Drew of New York. There are also schools at several points in the Southern states, in Germany, at Frankfort on the Main, and in India. At the close of the centennial year of American Methodism the church reported 25 colleges and theological schools, having 158 instructors, 5,350 students, about $4,000,000 in endowments and other property, and more than 105,000 volumes in their libraries; and also 77 academies, with 556 instructors and nearly 18,000 students of both sexes. 3. *Divisions.* (1.) In 1792 James O'Kelly and some other ministers, with a considerable number of members, dissatisfied with the appointing power being vested in the bishop, without appeal, and unable to effect any modification of a system which the great mass of the church cordially approved, withdrew from the denomination and formed themselves into "The Christian Church." (2.) In 1816 the colored members in and around Philadelphia organized themselves into the African Methodist Episcopal church. (3.) In 1820 a similar movement in and around New York resulted in the formation of the African Methodist Episcopal Zion church. (4.) In 1828 the Canada conference withdrew and became a distinct church. This separation was regarded by both sections as a matter of necessity, and was effected without any interruption of fraternal relations between them. (5.) In 1830 the Methodist Protestant church was formed, having at the outset 83 preachers and 5,000 members. (6.) In 1845, at a convention held in Louisville, Ky., impelled by differences of opinion, feeling, and policy on the subject of slavery, the Methodist Episcopal church, South, was formed by the withdrawal of the southern conferences, embracing about 1350 traveling and 3,160 local preachers, with 495,000 members. Through all these divisions and troubles the church pressed on vigorously with its work. During the war of the rebellion it stood with all its moral power on the side of the union, and more than 100,000 of its members entered the armies of their country. Before and after the close of the war it made preparations for celebrating the centenary of American Methodism by all its churches and people "with devout thanksgiving, by special religious services, and liberal thank-offerings," for which the month of Oct., 1866, was set apart. As at the end of the century, notwithstanding its losses, it contained more than a million of members, the hope was cherished that not less than twice that number of dollars would be given to promote its future work. The expected services were held throughout the church, and at the close of the month the total amount contributed was found to be $8,709,500. 4. *Admission of lay delegates into the general conference.* This important change was inaugurated in 1872, after long consideration throughout the church. The plan adopted provides that "the ministerial and lay delegates shall sit and deliberate together as one body, but they shall vote separately whenever such separate vote shall be demanded by one-third of either order; and in such cases the concurrent vote of both orders shall be necessary to complete an action." According to official reports for 1880 there are 95 annual conferences; 13 bishops; 11,798 itinerant and 12,620 local preachers, making with the bishops a total of 24,431; churches, 17,111, containing 1,723,147 lay members, on probation and in full connection; 20,754 Sunday-schools, containing 1,793,763 officers and scholars; amount contributed during the year for the support and extension of the gospel, at home and in other lands, not less than $14,500,000.

METHODIST EPISCOPAL CHURCH, SOUTH (METHODISTS, *ante*), was organized by a convention of delegates from the southern annual conferences which met at Louisville, Ky., May 1, 1845. Its first general conference met at Petersburg, Va., May, 1846. The property belonging to the whole church was divided, through the action of the supreme court of the United States, in accordance with the plan adopted by the general conference of 1844. A publishing house was established at Nashville, Tenn.; a quarterly review, weekly and Sunday-school papers, books, and tracts were printed. All things went on prosperously until the war of the rebellion hindered the work of the church and broke up its institutions. Much of its property was used by others during the continuance of military operations in the south, but the greater part of this has since been restored. The church is fast recovering from the effects of the war. At the separation, in 1844, the southern church contained about 450,000 members. In 1860 the number had increased to 757,205, of whom 207,766 were colored people. During the war these figures were greatly reduced. Some modifications in the government of the church

have been made. The annual conferences are composed of traveling ministers and four lay delegates (one of whom may be a local preacher) from each district. The general conference contains an equal number of ministerial and lay delegates. A revised edition of Wesley's abridged liturgy has been published, but is not much used. The ritual and the psalmody have been revised and improved. Much attention is given to Sunday-schools, and many publications for their use are prepared. Seminaries for both sexes, colleges, and universities have been established in different parts of the south. The publishing house has revised and reprinted the standard Methodist works, and have added to them many new books of history, biography, and theology. The publishing house, destroyed, in part, by fire in 1872, has been rebuilt on a much larger scale. The destitute portions of the south, laid waste by the war, require a large amount of missionary labor; and, in addition to this, missions have been established in China, Mexico, and among the Indians. The statistical reports for 1879, the latest that are accessible at the north, give 39 annual conferences; bishops, 6; traveling preachers, 3,867; local ditto, 5,832; members of churches, 822,476; Sunday-schools, 8,941; containing 58,528 teachers and 421,137 scholars. The total amount expended in supporting and extending the gospel at home and abroad is not reported.

METHODIST PROTESTANT CHURCH, organized in 1830 by a portion of the Methodist Episcopal church who, agreeing with the majority in doctrine, were opposed to the episcopacy and to the exclusion of the laity from a voice in the government of the church. Each annual conference elects by ballot its presiding officer, and in all legislation and government the laity and clergy equally participate. The general conference, meeting every four years, is composed of delegates elected by the annual conferences in the ratio of one minister and one layman for every 1000 communicants. Under specified restrictions it has authority to make rules for the government of the church declarative of the laws of Christ; to determine the duties and compensation of traveling ministers, preachers, and other officers; to devise ways and means for raising funds; and to declare the boundaries of the annual conferences. The annual conference, consisting of all the ordained itinerant ministers in the district, elects to orders, stations ministers, preachers and missionaries, makes rules for their support, and declares the boundaries of circuits and districts. The quarterly conference—composed of the trustees, ministers, preachers, exhorters, leaders, and stewards of a district—examines the official character of its members, licenses preachers, and recommends candidates for ordination to the annual conference. The classes, leaders, and stewards are similar to those in the Methodist Episcopal church. In 1858 the Methodist Protestant church was divided by differences on the subject of slavery into the Methodist Protestant church of the north-western states, with its headquarters at Springfield, Ohio; and the Methodist Protestants of the southern states, with headquarters at Baltimore. At the time of the division the church contained 2,000 stationed ministers, 1200 churches, 90,000 members, and property worth $1,500,000. In the hope of a speedy reunion of the separated branches, the Protestant Methodists, North, changed their name to *The Methodist Church*, and removed their headquarters to Pittsburg, Penn. Their college at Adrian, Mich., is flourishing. Their missionary board, while zealously engaged in the home work, has also formed plans for the foreign field. The strength of the Methodist Protestants, South, was principally in Virginia, Maryland, and some parts of Pennsylvania and Ohio. They have three colleges: the Western Maryland, at Westminster, Carroll co.; Yadkin college, North Carolina; and one in Western Virginia. Initiatory steps had been taken with a view to the union of all non-Episcopal Methodists under the title of *The Methodist Church*, but before this was accomplished the two branches of the Methodist Protestants met in convention at Baltimore in 1877 and formed an organic union under the original name of the Methodist Protestant church. In 1880 the reunited church reported 1314 itinerant ministers, 925 local preachers, and 113,405 lay members. Their headquarters are continued both at Baltimore and Pittsburg.

METHODISTS, the name originally given, about the year 1729, by a student of Christ Church to the brothers Wesley and several other young men of a serious turn of mind, then members of different colleges of Oxford, who used to assemble together on particular nights of the week chiefly for religious conversation. The term was selected, it is believed, in allusion to the exact and *methodical* manner in which they performed the various engagements which a sense of Christian duty induced them to undertake, such as meeting together for the purpose of studying Scripture, visiting the poor, and prisoners in Oxford jail, at *regular* intervals. Subsequently it came to be applied to the followers of Wesley and his coadjutors, when these had acquired the magnitude of a new sect; and though their founder himself wished that "the very name," to use his own words, "might never be mentioned more, but be buried in eternal oblivion," yet it has finally come to be accepted by most if not all of the various denominations who trace their origin mediately or immediately to the great religious movement commenced by John Wesley. For an account of the origin and earlier development of Methodism see articles on the brothers WESLEY and WHITEFIELD. We confine ourselves here to a brief notice of its organization, doctrine, and present condition.

1. *Organization.*—This appears to have been partly improvised by Wesley to suit the exigences of his position. It was not a theoretical and premeditated, but a practical and

extempore system. In the *Rules of the Society of the People called Methodists*, drawn up by himself, he says: "In the latter end of the year 1739, eight or ten persons came to me in London, who appeared to be deeply convinced of sin, and earnestly groaning for redemption. They desired (as did two or three more the next day) that I would spend some time with them in prayer, and advise them how to flee from the wrath to come, which they saw continually hanging over their heads. That we might have more time for this great work, I appointed a day when they might all come together, which from thenceforward they did every week, viz., on Thursday, in the evening." This he calls "the first Methodist society." Its numbers rapidly increased, and similar "societies" were soon formed in different parts of England, where the evangelistic labors of the Wesleys had awakened in many minds "a desire to flee from the wrath to come, and be saved from their sins" —the only condition, we may remark, required of any for admission into these societies. In order to ascertain more minutely how the work of salvation was progressing in individual cases, Wesley subdivided the societies into "classes," according to their respective places of abode, each class containing about a dozen persons, under the superintendence of a "leader," whose duties are partly religious and partly financial. 1. He has to see each person in his class once a week, "to inquire how their souls prosper," and to encourage, comfort, or censure, as the case may require. 2. To collect the voluntary contributions of his class, and pay it over to the "stewards" of the society, and to give the ministers all necessary information regarding the spiritual or bodily condition of those under his leadership. For preaching purposes, on the other hand, the societies were aggregated—a certain number of them constituting what is called a circuit. This now generally includes a town and a rural circle of 10 or 15 miles. To each circuit two, three, or four ministers are appointed, one of whom is styled the "superintendent;" and here they labor for at least one year, and not more than three. Every quarter the classes are visited by the ministers, who make it a point to converse personally with every member; at the termination of which proceeding a "circuit-meeting" is held, composed of ministers, stewards, leaders of classes, lay-preachers, etc. The stewards (who are taken from the societies) deliver their collections to a circuit-steward, and the financial business of the body is here publicly settled. At this quarterly meeting candidates for the office of the ministry are proposed by the president, and the nomination is approved or rejected by the members. Still larger associations are the "districts," composed of from 10 to 20 circuits, the ministers of which meet once a year, under the presidency of one of their number, for the following purposes: 1. To examine candidates for the ministry, and to try "cases" of immorality, heresy, insubordination, or inefficiency on the part of the clergy. 2. To decide preliminary questions concerning the building of chapels. 3. To investigate and determine the claims of the poorer circuits to assistance from the general funds of the body. 4. To elect a representative to the committee of conference, whose duty is to nominate ministers for the different stations for the ensuing year—their appointments, however, being subject to the revision of conference. In all the financial and other purely *secular* business of the districts, laymen (such as circuit-stewards and others) deliberate and vote equally with the clergy. The supreme Methodist assembly is the "conference." The first was held in 1744, when John Wesley met his brother Charles, two or three other clergymen, and a few of the "preachers"—men whom his zeal and fervor had induced to abandon their secular employments and devote themselves to declaring the message of the Gospel. The purpose for which he called them together was, he says, "for the sake of conversing on the affairs of the 'societies' . . . . . and the result of our consultations we set down to be the rule of our future practice." In the course of his life Wesley presided at 47 of these annual assemblies. The conference now consists of 100 ministers, mostly seniors, who hold their office according to arrangements prescribed in a deed of declaration, executed by John Wesley himself, and enrolled in chancery. But the representatives previously mentioned, and all the ministers allowed by the district committees to attend—who may or may not be members of the legal conference—sit and vote usually as one body, the 100 confirming their decisions. In this assembly, which is exclusively clerical, every minister's character is subjected to renewed and strict scrutiny, and if any charge be proved against him, he is dealt with accordingly; candidates for the ministry are examined both publicly and privately, and set apart to their sacred office; the entire proceedings of the inferior courts (if we may so call them) are finally reviewed; and the condition, requirements, and prospects of the body are duly considered.

2. *Doctrine and Worship.*—Under this head not much requires to be said. Wesleyan Methodists claim to be considered *orthodox*, *Protestant*, and *evangelical*. The propriety of the last two appellations will probably not be disputed, but a rigid Calvinist might object to the first. They accept the *articles* of the English church, but believing these articles to have been framed on a basis of *comprehension*, they consider themselves at liberty to accept them in an Arminian sense. It must not, however, be supposed that they are out-and-out Arminians. Their great distinguishing doctrine is the universality and freedom of the atonement; hence they reject the Calvinistic doctrine of predestination (which they conceive to be incompatible with the former), but while they maintain the freedom of the will and the responsibility of man, they also maintain his total fall in Adam, and his utter inability to recover himself. If these two appear to the human understanding to conflict, it is nevertheless asserted that the Bible teaches both; and it is

objected to high Calvinism that in its anxiety to be logical it has shown itself unscriptural. Prominence is also given by the Wesleyan Methodists to certain points of religion, some of which are not altogether peculiar to them. They insist on the necessity of men who profess to be Christians feeling a *personal interest* in the blessings of salvation—i.e., the assurance of forgiveness of sins and adoption into the family of God. This, however, is not to be confounded with a certainty of *final salvation*. They believe the spirit of God gives no assurance to any man of that, but only of *present pardon*. In harmony with this view, they reject the doctrine of the necessary perseverance of the saints, and hold that it is fearfully possible to fall from a state of grace, and even to perish at last after having "tasted of the heavenly gift," and having been "made partakers of the Holy Ghost." They also maintain the perfectibility of Christians, or rather the possibility of their entire sanctificaction as a privilege to be enjoyed in this life. But Wesley "explains" that "Christian perfection does not imply an exemption from ignorance or mistake, infirmities or temptations; but it implies the being so crucified with Christ as to be able to testify, 'I live not, but Christ liveth in me.'" He regards the sins of a "perfect" Christian as "involuntary transgressions," and does not think they should be called "sins" at all, though he admits that they need the atoning blood of Christ. The Wesleyan Methodists, in their religious services, use more or less the English liturgy; the morning service being read in many of their chapels, and the sacramental offices being required in all. They observe a "watch-night" on the eve of the new year, on which occasion the religious services are protracted till midnight, and their chapels are generally crowded to excess; and in the beginning of the year they hold a "covenant-service," at which congregations stand up to a man (though this form is not invariable), and solemnly vow to serve the Lord. But even the ordinary religious services in some places are frequently marked by an ebullition of fervent feeling on the part of the audience, which has a very singular effect upon a stranger.

3. *History*.—The history of Methodism is for many years the history of Christian effort to evangelize the neglected "masses" of England. The labors of Wesley, and of those whom he inspired to imitate his example, were of the noblest description, and met with remarkable success. The reformation of life which his preaching produced, for example, among the Kingswood colliers and the Cornwall wreckers, is a testimony to the power of religion which cannot be too highly estimated. The zeal which has inspired the body in regard to foreign missions, although in the highest degree honorable, is only the logical development of their efforts at home—for they originally regarded their society in England as simply a vast "home mission," and neither Wesley nor his followers desired to consider themselves a "sect," a new church, in the common usage of the term, but were warmly attached to the old national church, and considered themselves among her true children. When Wesley died (1791) his "societies" had spread over the United Kingdom, the continent of Europe, the states of America, and the West Indies, and numbered 80,000 members. Since then they have largely increased, and, according to the returns for the year 1875, the membership (including the numbers in foreign missions, embracing continental India, Northern Europe, China, Asia Minor, the South Sea and West India islands) amounted then to 564,315 (of whom 393,343 belonged to Great Britain and Ireland), and the number of ministers, 2,905 (of whom 2,050 belonged to the United Kingdom). The annual income of "The Wesleyan Methodist Missionary Society" in 1875 was £190,000.

The Wesleyan Methodists have three theological colleges for the training of ministers, one at Richmond Hill, Surrey, a second at Didsbury, South Lancashire, and a third at Headingley, in Yorkshire, besides the establishments at Sheffield and Taunton; two schools (New Kingswood school and Woodhouse Grove school) for the education of sons of Wesleyan ministers; and two for the daughters, one at Clapton and another at Southport. The boys receive a six years' and the girls a four years' course of instruction. The Methodist Book-room is situated in the City Road, London, and issues hundreds of thousands of religious publications (tracts, etc.) monthly. The newspapers and other periodicals, professedly in connection with the body, are the larger and smaller *Magazines*, the *Christian Miscellany*, *Wesleyan Sunday-School Magazine*, monthly *Exercises on Scripture Lessons*, *Early Days*, the *Watchman*, the *Methodist Recorder*, and the *London Quarterly Review*. Among the more eminent Methodist authors may be named the two Wesleys, Fletcher, Benson, Clarke, Moore, Watson, Drew, Edmondson, Sutcliffe, Jackson, Treffry, Rule, Nichols, Smith, and Etheridge.

Methodist Episcopal Church, the name given to the Society of Wesleyan Methodists in the United States, where the first members of that body—immigrants from Ireland—established themselves as a religious society in New York in the year 1766. In the course of a year or two their numbers had considerably increased, and they wrote to John Wesley to send them out some competent preachers. Two immediately offered themselves for the work, Richard Boardman and Joseph Pilmoor, who were followed in 1771 by Francis Asbury and Richard Wright. The agitations preceding the war of independence, which soon afterwards broke out, interrupted the labors of the *English* Methodist preachers in America, all of whom, with the exception of Asbury, returned home before the close of the year 1777; but their place appears to have been supplied by others of native origin, and they continued to prosper, so that, at the termination of the revolution-

ary struggle, they numbered 43 preachers and 13,740 members. Up to this time, the American Wesleyan Methodists had laid no claim to being a distinct religious organization. Like Wesley himself, they regarded themselves as members of the English Episcopal church, or rather of that branch of it then existing in America, and their "preachers" as a body of irregular auxiliaries to the ordained clergy. "Episcopal churches," we are informed, "are still standing in New York and elsewhere, at whose altars Embury, Pilmoor, Boardman, Strawbridge, Asbury, and Rankin, the earliest Methodist preachers, received the holy communion." But the recognition of the United States as an independent country, and the difference of feelings and interests that necessarily sprung up between the congregations at home and those in America, rendered the formation of an independent society inevitable. Wesley became conscious of this, and met the emergency in a manner as bold as it was unexpected. He himself was only a presbyter of the church of England, but having persuaded himself that in the primitive church a presbyter and a bishop were one and the same order, differing only as to their official functions, he assumed the office of the latter, and, with the assistance of some other presbyters who had joined his movement, he set apart and ordained the Rev. Thomas Coke, D.C.L., of Oxford university, bishop of the infant church, Sept. 2, 1784. Coke immediately sailed for America, and appeared, with his credentials, at the conference held at Baltimore, Dec. 25 of the same year. He was unanimously recognized by the assembly of preachers, appointed Asbury coadjutor bishop, and ordained several preachers to the offices of deacon and elder. Wesley also granted the preachers permission (which shows the extensive ecclesiastical power he wielded) to organize a separate and independent church under the episcopal form of government: hence arose the "Methodist Episcopal Church in the United States." Nevertheless, there were not a few who were dissatisfied with the Episcopal form of government. This feeling grew stronger and stronger, until, in 1830, a secession took place, and a new ecclesiastical organization was formed, called the METHODIST PROTESTANT CHURCH, whose numbers, according to the returns for 1874, amounted to 65,000 members and 924 preachers. In 1842 a second secession took place, chiefly on the question of slavery—the seceders pronouncing all slave-holding sinful, and excluding slave-holders from church membership and Christian fellowship; and in 1843 a meeting was held at Utica, N. Y., where a new society was constituted and named the WESLEYAN METHODIST CONNECTION OF AMERICA, whose members in 1870 amounted to 20,000, and its preachers to 250. But in 1844 a far larger and more important secession took place on the same question, when the whole of the Methodist societies in the then slave-holding states, conceiving themselves aggrieved by the proceedings instituted at the general conference of New York (1844) against the Rev. James O. Andrew, D.D., one of the bishops, and a citizen of Georgia, who had married a lady possessed of slaves, resolved to break off connection with their northern brethren. Hence originated the METHODIST EPISCOPAL CHURCH, SOUTH, whose numbers, in 1874, were as follows: Traveling preachers, 3,134; local preachers, 5,344; and members, 663,106, including whites, colored, and Indians. To these must be added 200,000 members forming the African Methodist Episcopal church, and 170,000 of the African Methodist Episcopal Zion church. In 1869 a movement began in favor of the reunion of the northern and southern sections of the Methodist Episcopal churches, which may—now that slavery is abolished—be successfully carried out. It may here be stated that the members of the *Northern Methodist Episcopal Church* amounted in 1874 to 1,345,089.

Returning to the English Wesleyan Methodists, we now proceed to mention the various secessions from the parent body in the order of time.

1. THE METHODIST NEW CONNECTION.—This society detached itself from the older one in 1797. Its doctrines and order are the same; the only difference being that it admits one layman to each minister into the conference, and allows them to share in the transaction of all business, both secular and spiritual. These laymen are chosen either by the circuits, or by "guardian representatives" elected for life by the conference. In 1875 the numbers of the new connection were: members, 24,760; preachers, 159. There were in addition 2,849 members on probation.

2. PRIMITIVE METHODISTS, vulgarly designated RANTERS, were first formed into a society in 1810, though the founders had separated from the old society some years before. The immediate cause of this separation was a disagreement as to the propriety of camp-meetings for religious purposes; and also upon the question of females being permitted to preach. A third point of difference is the admission to their conference of two lay delegates for every minister. In 1875 their numbers were: members, 179,429; preachers, 1169.

3. INDEPENDENT METHODISTS, who separated in 1810. They are chiefly distinguished by their rejection of a paid ministry, and number in England and Scotland: members, 4,000; preachers, 290; scholars, 6,000.

4. BIBLE CHRISTIANS, also called BRYANITES, were formed by a local preacher named Bryan, who seceded from the Wesleyans in 1815. The only distinction between them and the original body appears to be that the former receive the eucharistic elements in a sitting posture. In 1875 their numbers were: members, 26,699; preachers, 276.

5. UNITED FREE CHURCH METHODISTS have been recently formed by the amalgamation of two sects of nearly equal numerical strength. The older of these, called the WESLEYAN ASSOCIATION, originated in 1834 in the removal of one or two influential

ministers from the original connection Points of difference subsequently appeared with regard to the constitution of the conference. The younger sect, called the WESLEYAN REFORM ASSOCIATION, took its rise in 1849 through the expulsion of several ministers from the parent body on a charge of insubordination, and being founded on the same principles as the last-mentioned community, arrangements were entered into for their union, which was subsequently effected. Church independency, and freedom of representation in the annual assembly, are two of the most prominent distinctive traits in the organization of the united Methodist free church. Their united numbers in 1875 were: members, 71,317; ministers, 375; local preachers, 3,266. The *Wesleyan Reform Union* consists of about 20 ministers and 7,000 members, who have not amalgamated with the Methodist free churches.

This is perhaps also the most convenient place to notice the WELSH CALVINISTIC METHODISTS. They are not a secession from the followers of Wesley, but originated partly in the preaching of his friend and fellow-evangelist Whitefield, and partly in that of Howel Harris, a Welsh clergyman of the church of England. Whitefield was a Calvinist; Wesley, as we have seen, was on some points decidedly Arminian. A difference arose between them on the subject of election. Henceforward their paths lay in different directions. Whitefield, however, did not form a religious sect; and after his death (1769) his followers, being left without any distinct bond or organization, either followed the leading of the countess of Huntingdon (q.v.), or became distributed among other denominations, a large portion, especially in Wales, becoming absorbed in the new society gradually forming itself through the preaching of Howel Harris and his coadjutors. This body, however, was not formally constituted a religious society till the beginning of this century.

METHODIUS, a noted theologian of the eastern church of the 3d c.; one of the fathers and martyrs of the church. He was surnamed Eubulus and Eubulius. He was first the bishop of Olympa and Patara in Lycia, hence called Patarensis, and afterwards presided over the see of Tyre and Palestine. He is supposed to have died early in the 4th century. He was a contemporary of Porphyry, and suffered death probably in A.D. 303 or 311. Epiphanius says that "he was a very learned man, and a strenuous asserter of the truth." Jerome ranks him among the church writers. His principal works are *De Resurrectione*, against Origen; *De Creatis; De Libero Arbitrio; De Angelica Virginitate et Castitate*, written in the form of a dialogue; *Oratio de Simeone et Anna Seu in Festum Occursus et Purificationis B. Mariæ.*

METHOMANIA. See DIPSOMANIA, *ante.*

METHUEN TREATY, a commercial treaty between England and Portugal in 1703, so called in consequence of being negotiated by Paul Methuen of Corsham, English ambassador at Lisbon. It was agreed, by the treaty, that the wines of Portugal should be received by England at a rate of one-third less duty than those of France. In 1836 the Portuguese government relinquished the stipulations of the treaty.

METHYL is an organic radical homologous with ethyl (q.v.), being the lowest term in the series $C_nH_n + 1$, n in this case being equal to 2. Its formula is C_2H_3; but in its free state, two atoms unite to form a single molecule, so that free methyl is more accurately represented by $(C_2H_3)_2$. It is a colorless gas, of specific gravity 1.036; it burns with a very feeble bluish flame, and is not liquefied at a temperature of 0°. It is obtained by acting upon iodide of methyl with zinc, in the same manner as in the preparation of ethyl.

Like ethyl, it forms a very numerous class of compounds, of which the following are the most important: *Hydride of methyl* (C_2H_3,H), known as *light carbureted hydrogen* (q.v.), *marsh-gas*, and *fire-damp*, may be obtained either naturally or artificially. As a natural product, it sometimes issues from fissures in coal-seams, rushing forth as if under high pressure. These discharges of this gas are termed "Blowers" by the miners, and it is by the combustion of this fire-damp that the terrific explosions which occasionally take place in coal-pits are caused. For its combustion, twice its volume of oxygen (and consequently ten times its volume of air) is required; the resulting compounds being one volume of carbonic acid and two of steam. The vitiated air thus produced, which is utterly unfit for respiration, is known as the *after-damp* or *choke-damp*, and is as much dreaded as the explosion itself. Hydride of methyl is also one of the gaseous exhalations from marshes and stagnant pools; and the bubbles that rise to the surface when the mud at the bottom of a pond is stirred up, consist chiefly of this gas. It may be prepared artificially by strongly heating a mixture of crystallized acetate of soda, hydrate of potash, and powdered quicklime. It is a colorless, inodorous, tasteless gas, which may be breathed without apparent injury if well diluted with air. *Hydrated oxide of methyl* (C_2H_3O,HO), known also as *methylic alcohol*, *wood spirit*, and *proxylic spirit* (under which title its properties are described), is the strict homologue of vinous or ethylic alcohol (C_4H_5O,HO). *Oxide of methyl* (C_2H_3O), or *methylic ether*, corresponds to the ordinary, or, correctly speaking, the ethylic ether, and, like the latter, is produced by the distillation of a mixture of methylic alcohol and sulphuric acid. Oxide of methyl, like oxide of ethyl, combines with acids to form a class of ethereal salts, or compound ethers, as they are termed by some chemists—as, for example: Acetate of methyl (or methyl-acetic ether), C_2H_3O,$C_4H_3O_3$; butyrate of methyl (or methyl-butyric ether) C_2H_3O,$C_8H_7O_3$;

nitrate of methyl (or methyl-nitric ether), C_2H_3O,NO_5; salicylate of methyl (or methyl-salicylic ether), $C_2H_3O,C_{14}H_5O_5$. The last-named compound may not only be obtained by distilling a mixture of pyroxylic spirit with salicylic and sulpharic acids, but occurs ready formed in the vegetable kingdom, constituting the essential oil procured from the *betula lenta*, a species of birch, and from the *gaultheria procumbens*, or *winter green*.

Methyl may be made to enter into combination with bromine, iodine, chlorine, and fluorine, the bromide and iodide of methyl being colorless fluids, and the chloride and fluoride colorless gases. Amongst the most interesting of the numerous methyl compounds must be mentioned the artificial bases or alkalies, which can be obtained from ammonia by the substitution of one, two, or three equivalents of methyl for one, two, or three of the equivalents of hydrogen contained in the ammonia.

If only one equivalent of hydrogen is replaced by methyl, the resulting compound is $NH_2(C_2H_3)$ or C_2H_5N, an extremely alkaline gas known as *methylamine*, or *methylia*, which is more soluble in water than any other known gas; water at 55° dissolving 1150 times its bulk. It is a frequent product of the destructive distillation of nitrogenous substances; and it is present when many natural alkaloids, such as narcotine and morphia, are distilled with caustic potash. The product resulting from the substitution of two equivalents of methyl for two of hydrogen, and known as *dimethylamine*, closely resembles methylamine. When the three equivalents of hydrogen are replaced by three of methyl, the resulting compound is $N(C_2H_3)_3$ or C_6H_9N, a colorless gas, which is known as *trimethylamine*, or *trimethylia*, and has a disagreeable fishy odor. It occurs in large quantity in herring-brine, and has been detected in the spirit in which anatomical preparations have been long kept. It is also found in *chenopodium vulvaria* (stinking goose-foot), in the flowers of *cratægus oxyacantha* (common hawthorn), and in ergot of rye.

METHYLATED SPIRIT consists of a mixture of alcohol, of specific gravity 0.830, with 10 per cent of pyroxylic (q.v.) or wood-spirit. This addition of wood-spirit renders it unfit for drinking, although it scarcely interferes with its power as a solvent. It is allowed by the excise to be sold duty-free for manufacturing purposes, and for preserving specimens in museums.

METHYLENE, Bichloride of (C_2H_2,Cl_2), is an organic compound which has recently attracted much attention from its value as an anæsthetic agent. Dr. Richardson, who has long been studying the physiological properties of the methyl-compounds, with the view of finding amongst them a safer compound than chloroform, believes, from his experiments on animals, that in the subject of this article he has found such a compound. As the deaths from chloroform may be computed, according to him, at one in 1500 administrations, it is obvious that there is reason for searching for a still safer anæsthetic agent. Dr. Snow, as is well known, thought that he had discovered an almost positively safe agent in amylene ($C_{10}H_{10}$); but the value of more than 200 safe administrations was at once destroyed by two rapidly succeeding deaths; and hence a large number of successful cases of the new agent must be reported before it will displace chloroform from its present well-deserved position. In the article on methyl (q.v.), we have shown that the composition of hydride of methyl (or marsh gas) is expressed by C_2H_3,H, which may be written C_2HHHH. Now, according to the theory of substitutions, one, two, three, or even all four of the atoms of hydrogen may be replaced by a corresponding number of atoms of chlorine. Thus (*a*), if one atom of H be replaced by one atom of Cl, we have *chloride of methyl*, C_2H_3Cl; (*b*) if two atoms of H are replaced by two atoms of Cl, the resulting compound is *bichloride of methylene*, $C_2H_2Cl_2$, the C_2H_2 here representing a new radical termed methylene, of which very little is known; (*c*) if three atoms of H are replaced by three atoms of Cl, the resulting compound is *terchloride of formyle*, C_2HCl_3, or common chloroform, another radical, viz., formyle, C_2H, now appearing; (*d*) if the whole of the H is replaced by Cl, the resulting compound is *tetrachloride of carbon*, CCl_4. We thus have four new bodies which may be constructed step by step out of hydride of methyl or marsh gas, and similarly, by starting with tetrachloride of carbon, the chemist may retrace the individual stages till he gets back to marsh gas. All these derivatives of marsh gas possess the power of producing anæsthesia when they are inhaled as vapor by men and animals. That the latter two—viz., chloroform and tetrachloride of carbon—possess this power, has been long known, Dr. P. Smith having especially directed attention to the properties of the last-named compound; but that the first two also exert the same influence is a fact new to science, for which we are indebted to Dr. Richardson. "I discovered," he observes, "that chloride of methyl was a certain and gentle anæsthetic in July [1867] last, and this led me to hope that something more stable and manageable could be obtained—something that should stand between the chloride of methyl and chloroform. That substance is now found in the bichloride of methylene. That this compound would produce rapid, safe, and easy general anæsthesia, I discovered by experiment on Aug. 30 of the present year."—*Med. Times*, Oct. 19, 1867.

It is a colorless fluid, having an odor like that of chloroform; and is pleasant to inhale, as it causes little irritation to the mucous membrane. It boils at 88°, and has a spec. gr. of 1.344, while that of its vapor is 2.937 (or nearly three times that of air).

Hence, it boils at a lower temperature than other anæsthetics; while its specific gravity, both as a liquid and a vapor, is lower than that of chloroform, but much higher than that of ether; hence, from its easier evaporation, it requires more free administration than chloroform, and, from its greater vapor-density, it should be given less freely than ether. It mixes readily with absolute ether, and this combination yields a vapor containing corresponding proportions of each, their boiling-points only differing at most by 4°. It also combines with chloroform in all proportions. It should have a neutral reaction to test-paper. If a trace of acid be present—which is possible, but not probable—its inhalation might prove dangerous. To prevent decomposition, it should, like chloroform, be well guarded from the action of light.

Pigeons are the animals which Dr. Richardson most employs for experiments on anæsthetic agents generally. They present various advantages over most other animals; one of the most important being that they die with singular readiness under the influence of these agents. On exposing three pigeons to the action of the vapor of a dram of chloroform, bichloride of methylene, and tetrachloride of carbon, the peculiarity in the action of the bichloride is the absence, in the sleep it produces, of the so-called second degree of narcotism. The bird glides from the first degree directly into the third, or that of absolute insensibility. The bichloride enters the circulation freely, and sustains the insensibility so well, that intervals of many minutes may be allowed to pass without readministration; while, from its being transformed altogether into vapor at a temperature lower than that of the body, it can be more readily eliminated from the system than chloroform, or tetrachloride of carbon, when its administration is withheld. On animals it acts more evenly on the respiration and circulation than any other of the various substances which Dr. Richardson has tried; and the only drawback yet observed is, that it sometimes produces vomiting; but this misadventure, so far as we know, has not yet been observed when it has been administered to the human subject, and pigeons are known to vomit on slight provocation. The numbers of the respirations and of the pulse rise and fall together, which "is a good point, because there is no condition more perilous than disturbed balance of the circulating and respiratory systems."

All anæsthetics given by inhalation after a certain dose destroy life; but that the destructive power of this new agent is less than that of either chloroform or tetrachloride of carbon, seems proved.

On trying the vapor upon himself, after ascertaining that it could be safely given to the lower animals, Dr. Richardson inhaled it until it produced insensibility. "I found the vapor very pleasant to breathe and little irritating, while drowsiness came on and unconsciousness without any noise in the head or oppression. I recovered also, as the animals seemed to recover, at once and completely. I felt as though I had merely shut my eyes, and had opened them again. In the mean time, I had, however, performed certain acts of a motor kind unconsciously; for I inhaled the vapor in the laboratory, and there went to sleep, but I awoke in the yard adjoining. This was on Sept. 28 last, when I inhaled from a cup-shaped sponge. Since then, I have inhaled the vapor in smaller quantities from several instruments, with the effect of proving that there is little difference required for its administration and that of chloroform. A little more bichloride is required in the earlier stages than would be required if chloroform were being used, the fluid being more vaporizable. One dram of bichloride to 40 minims (⅜ds of a dram) of chloroform represents the difference required; but when the narcotism is well set up, less of the bichloride is required to sustain the effect."

The materials on which this article is based are taken from a lecture delivered by Dr. Richardson on Oct. 8, 1867. In an address on anæsthetics by Dr. Tidy, published in the *British Medical Journal*, Jan. 4, 1879, it is mentioned that Mr. Morgan, a dentist, has "administered methylene 1800 times to persons of all ages, and for periods varying from a few minutes to three-quarters of an hour, without a single accident. He also regards it as safer than chloroform, and speaks of the rapidity with which it effects complete unconsciousness, as a rule two minutes only being needed; the rapidity of recovery, from one to three minutes only being required for the anæsthesia to pass away; and lastly, the rapidity with which consciousness may be abolished, if it return during the operation—as the chief points in its favor. The cause of death from its administration is syncope, not coma; hence, a bloodless condition of the lips—a point easily to be noticed—is the principal indication of danger."

On the other hand, the preliminary report on the action of anæsthetics presented to the committee of the British medical association, and published in the same number of the *Journal*, does not speak so favorably of methylene. The so-called bichloride of methylene, it is alleged, has no definite and constant boiling point, and therefore appears to be a mixture. The formula, as now generally used, CH_2Cl_2, shows it to be a compound of chloride of methyl and chloroform ($CH_3Cl + CHCl_3$). With frogs under methylene it was found that the heart became rapidly affected and soon stopped. With rabbits, respiration rapidly deteriorated and stopped while the heart was still beating. In an experiment with artificial respiration and exposure of the heart, the heart was weakened and soon stopped, but not as rapidly as with chloroform. As in the case of chloroform, the right ventricle became enormously distended, the first sign of paralysis being the commencement of the distension. [Ether does not affect the heart.] The experimenters found that as anæsthetics, *isobutyl chloride* (C_5H_9) and *ethidene dichloride*

($C_2H_4Cl_2$) combine the advantages of speed and safety, and are therefore preferable to methylene.

Chloride of methyl, the first of the compounds derived by substitution from hydride of methyl, has, according to good authorities, also valuable remedial qualities. Half an ounce of it, diluted with water, and with the addition of a little sugar, acts as a pleasant but potent intoxicator. In smaller doses, it might be useful as a soothing and refrigerating agent.

METON'IC CYCLE, so called from its inventor, Meton, who flourished at Athens about 432 B.C., is a cycle of 19 years, at the end of which time the new moons fall on the same days of the year, and eclipses recur in nearly the same order. This arises from the circumstance, that 19 solar years are nearly equal to 235 lunations, their average values being 6939.68835 and 6939.60249 days respectively.

METON'IC CYCLE, *ante*. The discovery of the Metonic cycle forms an era in the history of the early astronomy of Greece. The Chaldeans established several luni-solar periods; and the difficulty of reconciling the motions of the sun and moon, or of assigning a period at the end of which these two luminaries again occupy the same positions relatively to the stars, had long embarrassed those who had the care of regulating the festivals. The discovery of Meton, therefore, which was brought into use on July 16, 433 B.C., was received with acclamation by the people assembled at the Olympic games, and adopted in all the cities and colonies of Greece. It was also engraved in golden letters on tables of brass, whence it received the appellation of the *golden number*, and has been the basis of the calendars of all the nations of modern Europe. It is still in ecclesiastical use, with such modifications as time has rendered necessary.—The period of Meton consisted of twelve years, containing twelve months each, and seven years containing thirteen months each; and these last formed the 3d, 5th, 8th, 11th, 13th, 16th, and 19th years of the cycle. He divided the cycle into 125 full months of 30 days, and 110 deficient months of 29 days each; the whole exceeding 19 revolutions of the sun by 9½ hours, and exceeding 235 lunations by 7½ hours. A century after Meton, his cycle was corrected by Calippus by quadrupling the period of 6,940 days, and deducting one day at the end of that time by changing one of the full months into a deficient month. By this change the error of lunation was reduced to one day in 304 years. The calendar, as laid down by Ideler, was as follows:

Months.	Year of the Cycle.																		
	I.	II.	III.	IV.	V.	VI.	VII.	VIII.	IX.	X.	XI.	XII.	XIII.	XIV.	XV.	XVI.	XVII.	XVIII	XIX.

METON'YMY (Gr. *metonymia*, signifying a change of name) is a figure of speech by which one thing is put for another to which it bears an important relation, as a part for the whole, the effect for the cause, the abstract for the concrete, etc. For example, "*Lying lips* are an abomination to the Lord." This figure is very expressive, and is much used in proverbial and other pithy modes of speech.

MET'OPE, the space, in the frieze of the Doric order, between the triglyphs—generally ornamented with figures, or bulls' heads, or pateræ.

MET'RA, an ingenious pocket-instrument, invented by Mr. Herbert Mackworth about 1858. It combines the thermometer, climometer, goniometer, anemometer, level, plummet, scales, etc., so that, by its assistance, travelers or engineers can at once record their observations. It enables us to determine the dip of rocks, angles of crystals, temperature, rate of wind, to take levels of large surfaces, determine latitude, and a variety of other matters connected with physical science. As a pocket-instrument it is of great value.

METRIC SYSTEM (Meter, *ante*). The modern or decimal system of measurement takes name from its unit, the meter. It should be understood that all Indo-European nations originally counted by twelves. They were exposed to the influence of Ur-altaic

races, who seem to have preferred threes and sixes. From the Egyptians they borrowed the count by tens, and from Shemites periods of sevens, and the double-ten or score. All these systems, complicated with varying units as bases, may be traced in the tables of measurement of modern Europe. Besides, although the value of place in notation was known to the Babylonians—and, in fact, it is not easy to write mixed measurement without assuming it—the general use of decimal notation in Europe dates only from the renaissance. Common measurements, then, do not agree with our notation, and the metric system does. It is not in itself best fitted for treating a universal unit, because it neither divides nor cubes as well as a series of doublings—the binary system. As, for instance,

1	32
2	64..... $= 8^2$.... $= 4^3$
4..... $= 2^2$	128.....
8..... $=2^3$	256..... $= 16^2$
16..... $= 4^2$	512..... $= 8^3$ etc., etc.,

or a count by eights, thus:

Units.	Oktads.	16ads.
1	$8 = 2^3$	$64 = 8^2$ and 4^3
2	$16 = 4^2$	128
3	24	192
$4 = 2^2$	32	$256 = 16^2$
5	40	320
6	48	384
7	56	448 etc., etc.,

when $64 = 4^3$ and 8^2 is written $100 = 4^3$ and 10^2, and $256 = 16^2$ is written $400 = 20^2$. But the binary system is open to the slight objection that it takes eight naughts to express 512, and oktads are evidently more cumbrous than dekads. A system of dodekads would match our multiplication table, correspond better with the traditions of our race, and have the inestimable advantage of possessing 6 and 3 as factors, without which the circle, geometrically considered, can hardly be grappled with. The meter is neither a part of an ascertainable distance nor the true portion of that distance as ascertained; the English yard, 39.13929 in., or the length of a pendulum vibrating seconds of mean time in vacuo, at the latitude of London and the level of the sea, being much more easily and surely measured. The advantages of the metric system are that it is a settled measure, in use by more people than any one other, and that its divisions correspond with what must always remain the notation of the educated world. It was made compulsory in France in 1840, legal in England in 1864, and in the United States by act of July 28, 1866. Its friends have as yet failed to render it acceptable to the nation, and apparently from misconception of the wants and prejudices of the populace. They have not decided upon any neat or consistent way of expressing its abbreviations, so that draftsmen and printers are either unwilling or unable to use them. They have neglected to make for workmen comparative tables giving its equivalents in the measures daily in use by them, and they have never succeeded in giving to the public a few brief rules for interchanging quantities, not necessarily exact, but near enough for hourly use. It is plain that a sudden change in the whole system of measures of a country involves loss of time with perplexity and expense. The advantages of a decimal notation may be shown by retaining some known unit and the popular names, but with change of other divisions: as an English foot, but of 10 in. and running 10 to the pole, etc., very much like the temporary change by the Swiss confederation; or by fixing upon some point which nearly coincides, changing that by legislation to an exact part of the right system, and leaving to time the gradual displacement of the more cumbrous. Thus the addition to an English inch in a yard made equal to a meter is easily made allowance for by tradesmen and workmen on a scale of the present pattern. This seems to account for the failure of the French law of Feb. 11, 1812.

The unit of the system is the METER, one ten-millionth of the calculated distance from the pole to the equator. See CHEMISTRY, *ante* (diagram). By prefixing the Greek words *deka*, *hekto*, *kilo*, and *myria* for multiples, and the Latin *deci*, *centi*, and *milli* for divisionals, there results a series of terms, each increasing by a power of ten. The LITER, or cubic decimeter, of water furnishes a standard for capacity, and a subdivision of it, the GRAM, or cubic centimeter, for weight. We have, then, five kinds of measures, of length, surface, volume, capacity, weight, and (but not carried out) money. It must be noticed that the French law supposes a double and a half to each measure; that many of the divisions have not been adopted in common use; and that certain modifications based on a larger unit have been found convenient in practical and scientific use. One advantage of the decimal system is that when speaking, say of kilom. for distance, or milligr. for weight, we may write 19.736 kilom., or 113.26 milligr., that is without treating them from the scale of meters or liters.

MEASURES OF LENGTH.

Myriameter.....	myriam.	=	10,000	m.	= 6.2137 miles.
Kilometer.....	kilom.	=	1,000	"	= 3,280 ft. 10 in..

Hektometer.....	hektom.	=	100	"	=	328 ft. 1 in.
Dekameter.....	dekam.	=	10	"	=	32 ft. 9.7 in.
METER.....	m.	=	1	"	=	39.3707904 in.
Decimeter.....	decim.	=	0.1	"	=	3.937 in.
Centimeter.....	centim.	=	0.01	"	=	0.3937 in.
Millimeter.....	millim.	=	0.001	"	=	0.0394 in.

Surveyors' chains are a dekam., a double or a half dekam. in length. The cable-length is 200 m.

MEASURES OF SURFACE.

Superficial.

SQUARE METER.....	sq. m.	= 1.	sq. m.	=	1,550 sq. in.
Square decimeter.....	sq. decim.	= 0.01	"		or
Square centimeter.....	sq. centim.	= 0.000,1	"		10.747 sq. ft.
Square millimeter.....	sq. millim.	= 0.000,001	"		

Note that the sq. decim. is not the tenth of a sq. m., but the square of a tenth, a hundredth. It follows that the decimals are read by pairs; thus, 3.532 sq. m. is read 3 sq. m., 53 sq. decim., 20 sq. centim., etc., etc.

Topographic.

Square myriameter,	sq. myriam.	= 100,000,000 sq. m.	
Square kilometer,	sq. kilom.	= 1,000,000 "	= 0.385496 sq. miles.
Square hektometer,	sq. hektom.	= 10,000 "	
Square dekameter,	sq. dekam.	= 100 "	

Agrarian.

Hektare.....	hekta.	=	10,000 sq. m.	=	2.471 acres.
ARE.....	a.	=	100 "	=	119.6 sq. yds.
Centiare.....	centia.	=	1 "	=	1150 sq. in.

Myriameters and myriares are used only in geographical or statistical works, and the hektare, like our acre, is the general unit in speaking of farm-land. While the sides of the measures differ by tens, their surfaces differ by hundreds. There are no such terms as decare, kilare, deciare, and milliare, for they are not squares of any multiple of ten.

MEASURES OF VOLUME.

Cubic Measure.

CUBIC METER....	cu. m.	= 1.	cu. m.	=	35.31481 cu. ft.
Cubic decimeter...	cu. decim.	= 0.001	"		
Cubic centimeter..	cu. centim.	= 0.000,001	"		
Cubic millimeter..	cu. millim.	= 0.000,000,001	"		

As before, the tenth of a cubic meter must not be confounded with the cubic decim.; the first is contained ten, the second a thousand times in a cu. m. Decimals must therefore be read by threes; thus, 5.427,93 cu. m. must be read 5 cu. m., 427 cu. decim., 930 cu. centim., etc.

MEASURES FOR FIRE-WOOD.

Dekastere.....	dekast.	=	10.	st.	
STERE.....	st.	=	1.	" or cu. m.	= 1.308 cu. yds.
Decistere.....	decist.	=	0.1	st.	

Note that the decist. is equal to one-tenth of a st., or cu. m., and is not to be confounded with cu. decim.

MEASURES OF CAPACITY.

Unit, the *liter*, equivalent to one cubic decimeter.

			Dry Measure.	Wine Measure.
Myrialiter.....	myrial.	=		
Kiloliter.....	kilol.	=		264.17 galls.
Hektoliter.....	hektol.	=	2 bu. 3.35 pk.	
Dekaliter.....	dekal.	=	9.08 quarts.	
LITER.....	l.	=	0.908 "	1.0567 quarts.
Deciliter.....	decil.	=	6.1022 cu. in.	0.845 gills.
Centiliter.....	centil.	=		0.338 fl. oz.
Milliliter.....	millil.	=		0.27 fl. dr.

The myrial. and kilol. are seldom used; but for grains, potatoes, seeds, as well as alcohol, wine, and oil, the hektol. is in general use. The liter is used as we use both gallon and bushel. The kilol. is a cu. m., the hektol. its tenth part, and the liter a thousandth.

MEASURES OF WEIGHT.

Unit, the *gram*, weight of a cu. centim. of distilled water, at the temperature of melting ice, 4° C., in the latitude of Paris, in vacuo, and altitude reduced to sea-level.

Metric ton	met. ton	=	2,204.6	lbs. avoir.
Metric quintal	met. quint.			
Kilogram	kilo.	=	2.2046	" "
Hektogram	hektogr.	=	3.5207	oz. "
Dekagram	dekagr.			
GRAM	g.	=	15.432	gr. "
Decigram	decigr.			
Centigram	centigr.			
Milligram	milligr.	=	0.0154	" "

The kilo. is the weight of a cu. decim. of water, or a liter. The met. ton is therefore that of a cu. m. of water.

The application of the metric system to coins has not yet been adopted, to the exclusion of any other, by any nation. The republics and the minor kingdoms have a more or less perfect series.

The division of the circle into 100° never was a success, and for reasons already noted. It has been proposed to substitute 600°, or six sextants of 100° each. But, if any change be advisable 120° seems preferable, being handily small, and divisible by 2, 3, 4, 5, 6, 8, and 10.

The thermometer of Celsius, or the centigrade (100°), has 0° at freezing, 32°, and 100° at boiling water, 212°, of the Fahrenheit. It is translated into Fahrenheit, F., or Réaumur, R., by the formula:

$$C = \frac{5}{9}(F - 32) \text{ or } \frac{5}{4}R.$$

The Wedgwood pyrometer, W., has its 0° at 580.56° C., and each degree of W. = 72.22° C.

The measure of work is the kilogrammeter, or 1 kilo. raised 1 m. high in 1 second, or 7.233 f. lbs., and a horse-power equals 75.73 kilogmet. It has been proposed to substitute tonmeters, when 1 h.p. = 13.47 tonmet. The atmospheric pressure is reckoned at 1.033 kilo. to the sq. centim. The following approximate rules are useful for every-day necessities. As there are 96 eighths to one foot, a drawing to the scale of

$\frac{1}{8}'' = 1'$ is equiv. to 1 centim. = 1 m. nearly.
$3'' = 1'$ " " " 2.5 decim. = 1 m., etc.

Five miles = 8 kilom., and a little more.
The meter is 3 ft. 3 in. $\frac{3}{8}''$, nearly.
The decim. is 4 in., slack.
The centim. is $\frac{3}{8}''$, full.
The sq. meter is $10\frac{1}{2}$ sq. ft., and more.
The sq. mile contains nearly 3 sq. kilom., and the sq. kilom. is 247 acres.
The hekt. is nearly $2\frac{1}{2}$ acres.
The are is a rood, nearly.
Three cu. yds. contain nearly 4 cu. m.
One cu. m., or st., equals $\frac{7}{8}$ of a ton of coal, of 40 cu. ft., which is also the U. S. shipping ton, or 33 U. S. bushels; and 2 cords of wood contain a little more than 7 steres.
The liter is a quart, both dry and wine measure (nearly 6 of our so-called quart bottles to 4 liters).
Four and a half l. to the gallon, imperial.
A new 5 cent nickel weighs 5 grams.
Fifteen grams of letter-weight are called $\frac{1}{2}$ oz. avoir.
The kilo. is 2 pounds, full.
The met. ton is the old big ton.
One horse-power, 33,000 foot-pounds, is 75 kilogmets.
Mechanical equiv. of heat, 772 f. lbs., is 425 kilogmets.

MET'RONOME, a valuable small machine for indicating the correct time or speed at which a musical composition should be played. It was invented in 1815 by Mälzel, the inventor also of the automaton trumpeter. See AUTOMATON. The test of a correct metronome is, that when set at 60 it shall beat seconds.

METROPOLIS, a city in Illinois, on the n. bank of the Ohio river; pop., '70, 2,490. It is 38 m. e. of Cairo, and 11 m. above Paducah. Its streets are regularly laid out, of a uniform width, and it is built on a high bluff, which slopes gradually toward the river; the lowest line being above high-water mark in the greatest floods. It has a bank, 8 churches, and 2 newspapers. The principal manufactories are potteries and tobacco factories. Lumber is manufactured; it has 2 ship-yards and several flour-mills.

METROP'OLIS LOCAL MANAGEMENT ACT. The metropolis of the United Kingdom, owing to its immense size, has been regulated for ædile and sanitary purposes

chiefly by special acts, one of which is called the metropolis local management act. It had long been subject to a special building act, which laid down minute regulations as to the formation of streets, alteration and building of houses; and the metropolis buildings act still contains a code applicable to building regulations, the chief principle of which is, that no person can build or make alterations till they have been duly approved by the inspectors, whose duty it is to see that certain conditions have been complied with as regards the public safety. In 1855 a great change was made in the internal economy of the metropolis by the metropolis local management act, which created the metropolitan board of works, and provided it with extensive powers of drainage, sewerage, lighting, cleaning, removing nuisances, and general improvements, and with powers also to rate the occupiers of houses for the expenses of the general management. Formerly, each vestry did what it thought proper within its own parish, and there was no uniformity observed in the details of management. But the above act contained a code of laws affecting numerous details of street and city life. One important function was the systematic construction of sewers and the removal of nuisances. No new building is now allowed to be built without sufficient drains and water-closets. Paving is enforced in most cases.

METROPOLITAN, in church law, the bishop of a *metropolis*, or "mother city," upon which other episcopal cities are in some sense dependent. The gradations of the hierarchy, on which this dependence is founded, are of very early origin, and may, it is alleged, be traced, at least in germ, in the letters of St. Paul to Timothy and to Titus. The commentaries of the Fathers (as Chrysostom, 15 *Hom. in* 1 *Tim.*, and Eusebius, *Hist. Eccles.* l, iii. c. iv.) recognize it as of apostolic institution. The jurisdiction of metropolitans, according to the ancient law of the church, was very considerable, and extended over all the bishops of that province of which the metropolitan see was the capital. It was their privilege not only to summon and preside over provincial councils, to consecrate the provincial bishops, but also to decide certain causes, and in other ways to exercise authority within the sees of their suffragans. Recent canons have very much restricted their powers. The metropolitan is distinguished from an ordinary archbishop by his having suffragan bishops subject to him, which is not necessarily the case of an archbishop.

In the church of England the archbishops of Canterbury and York are metropolitans, and in the Protestant Episcopal church of Ireland, those of Armagh and Dublin. In the newly constituted hierarchy of the Roman Catholic church in England, the archbishop of Westminster has the rank of metropolitan. In the Roman Catholic church of Ireland, the archbishops of Armagh, Dublin, Cashel and Tuam all possess the same rank.

METTERNICH, Clemens Wenzel Nepomuk Lothar, Prince von Metternich, and duke of Pontella, an eminent Austrian diplomatist and statesman, was b. at Coblenz, May 15, 1773. His father, Franz Georg Karl, count von Metternich, was also an Austrian diplomatist, and an associate of Kaunitz. He represented a very ancient and distinguished family, whose original seat was in Jülich. Young Metternich was educated at the university of Strasburg, and afterwards studied law at Mainz and traveled in England. In 1795 he married the granddaughter and heiress of the celebrated minister Kaunitz, by whom he acquired large estates. His diplomatic career commenced at the congress of Rastadt, which he attended as representative of the Westphalian counts. His rise was very rapid: he added to the advantages of his birth and connections, a more than ordinary share of diplomatic ability, with the most graceful and winning manners. In 1801 he became Austrian ambassador at Dresden; and on the outbreaking of the third coalition war, he negotiated the treaty of alliance between Austria, Prussia, and Russia. In 1806 he went as ambassador to Paris, and concluded, in 1807, the treaty of Fontainebleau, very favorable to the interests of Austria; but on the outbreaking of the war between France and Austria in 1809, he was detained some time ere he could obtain his passport. In course of that year, he succeeded count von Stadion as minister of foreign affairs, concluded the treaty of peace with the French minister Champagny, and accompanied the empress Maria Louisa to Paris. He guided the course of Austria amidst the difficulties of 1812–13. He maintained at first a temporizing policy and a scheme of an armed mediation of Austria; but the obstinacy of Napoleon reduced him to the necessity of adopting at last a decided step, and led him to resolve upon that declaration of war by Austria against France, which took place in Aug., 1813, and he subsequently conducted with great ability the negotiations which ended in the completion of the quadruple alliance. On the eve of the battle of Leipzic, the emperor of Austria bestowed upon him the princely dignity. He was afterwards employed in almost all the chief diplomatic affairs of that eventful time; and after the congress of Chatillon and negotiations with the count d'Artois, he went to Paris, and signed the convention of Fontainebleau with Napoleon, went to England to negotiate concerning a new quadruple alliance, and attended the congress of Vienna, of which he was unanimously elected president. He signed, as Austrian plenipotentiary, the second peace of Paris Nov. 20, 1815. After this, he continued still to conduct the diplomacy of Austria, and in 1821 was appointed chancellor (*Haus-, Hof und Staatskanzler*), and in 1826 succeeded count Zichy in the presidency of ministerial conferences on home affairs. His efforts

were now earnestly directed to the maintneence of peace in Europe, and the preservation of the existing state of things in the Austrian dominions by the strictest measures of police and severe despotism. The revolutionary movement of 1848 breaking forth with sudden violence, caused the aged minister to flee from Austria, and to seek refuge in England; nor did he return to Vienna till the end of 1851, when he received great marks of honor and favor from the emperor; but although sometimes consulted, he was never again asked to undertake the cares of office. He died at Vienna, June 11, 1859. The general opinion respecting Metternich has been well expressed by the *Times* newspaper: "He was renowned rather than great, clever rather than wise, venerated more for his age than his power, admired but not lamented." His son Richard became ambassador at the court of Napoleon III. after the peace of Villafranca.

METTRAY. The reformatory of Mettray is the true parent of all institutions intended to reform and restore to society, and not merely to punish, juvenile delinquents. Mettray Demetz, a member of the Parisian bar, struck with the evils and hardship attending the committal to prison of young, and, considering their training and habits, scarcely responsible criminals, there to languish hopelessly for a time, and then to emerge worse than when they entered, resolved, in conjunction with the Vicomte Bretignères de Courteilles, to found a school which should have for its object the reformation of this class of offenders. In 1839 accordingly, the reformatory, or, as it is called, the colony of Mettray, was set on foot, about 5 m. from the city of Tours in France. Thus M. Demetz, by his assiduous labors and self-devotedness, rendered to France and Europe one of the greatest benefits that could be conferred on society, by proving that, by agricultural and other labors of industry, and well-considered rules of organization and discipline, the neglected and criminal may be trained to take their place honestly and honorably in society. The children consist wholly of orphans, foundlings, and delinquents, and, in 1872, amounted in number to 792. From the foundation up to that date, 4,287 had been received. The relapses into crime of those who had left the colony amounted only to about 4 per cent. The success of this establishment is to be attributed not solely to the excellent training and close supervision at Mettray itself, but to the care which is taken to preserve the link between the authorities and those who have left the colony. A small payment is made by the state for children sent under judicial sentence; the large extra expenditure necessarily incurred being defrayed from charitable contributions from the individuals constituting the "paternal society of Mettray."

METZ, the strongest fortress of the German imperial territory of Alsace-Lorraine, and capital of the district of Lorraine; before 1871, the main bulwark of France in her north-eastern frontier, and capital of the department of Moselle. It is situated on the Moselle at its confluence with the Seille. The strength of Metz consists in its exterior defenses, of which the principal are 11 forts, partly strengthened and improved since the German occupation, and partly entirely new. The city contains many important institutions, barracks, hospital, military schools, and arsenals. The cathedral, a Gothic edifice, begun in 1014, and finished in 1546, is remarkable for its boldness, lightness, and elegance, and has a beautiful spire of open work, 373 ft. in height. The industry of Metz is active; there is a good trade in wine, brandy, indigo, glass; and there are several cloth manufactories in the neighborhood. The pop. of Metz, which in 1869 was 48,325, had in 1875, by reason of emigration into France, decreased to 37,925, or with garrison, 45,856.

Metz, known to the Romans as *Divodurum*, was afterwards called Mettis (corrupted from Mediomatrici, the name of the people), and hence the present form. Under the Franks, Metz was the capital of Austrasia (q.v.). At the division of Charlemagne's empire, Metz, with the rest of Lorraine (q.v.), fell to Germany, and was afterwards made a free city of the empire. In 1552 it was treacherously taken possession of by the French; and although Charles V. besieged the place from October, 1552, to January, 1553, they kept it till it was formally ceded to them in 1648. In August, 1870, Bazaine was compelled to retire into Metz with his army; and after an investment of 70 days, during which no attempt was made to take the city by force (not even a single shell having been fired into it), Europe was startled to hear of the capitulation of Metz, by which 180,000 men and immense military stores fell into German hands (Oct. 27, 1870). By the treaty of Frankfort, Metz was annexed to Germany as part of Lorraine.

METZU, GABRIEL, 1615–67; was b. at Leyden, in s. Holland. Little is known of his early life, and from what artist he acquired his education in the rudiments of painting is unknown. He was, however, still young when already possessed of a high reputation at Amsterdam. As a painter he belonged to the Dutch school, and was essentially a materialist in art. Although he painted a few portraits, most of his subjects were taken from commonplace scenes of middle-class or humble domestic life. Of imagination or high artistic conception he had but a small share; but in minuteness of detail, in perfection of coloring and execution, he was very remarkable. His subjects were such as morning visits, musical parties, ladies at their toilet, a cavalier smoking and drinking at a cabaret; in short, he was a *genre* painter, and in exact reproduction of scenes of familiar life stands very high. His work commands a great price, and many excellent specimens are to be found in the *Louvre* and the other principal art-galleries of Europe.

It has been asserted that Metzu died in 1658, but one of his best and undoubtedly genuine works bears date 1667.

MEUDON, a t. of France, in the dep. of Seine-et-Oise, 5 m. w. of Paris, on the Versailles and Paris railway. The château, approached by a fine avenue of four rows of lime-trees, was built by the side of an older château, the work of Philibert Delorme, by the grand dauphin, son of Louis XIV., in 1699. During the revolution it was converted into a factory for warlike engines, and surrounded with a permanent camp to keep out spies. The château, as it exists at present, was fitted up for Marie Louise by Napoleon in 1812. It has a fine terrace, gardens beautifully laid out, and commands a very fine prospect. The Forêt de Meudon is a favorite holiday resort of the Parisians. Near it has been erected an expiatory chapel, dedicated to Notre Dame des Flammes, marking the spot where a terrible railway accident occurred in May, 1842, in which more than 100 persons were burned alive. Whiting is manufactured to a considerable extent, and there are numerous bleachfields. Rabelais was curé of Meudon for a long time. The château was for many years a favorite summer residence of Prince Napoleon. Pop. '76, 6,385.

MEU'LEBEKE, a t. of Belgium, in the province of West Flanders, 20 m. s.w. of Ghent, on the Mandel, a tributary of the Lys. Weaving is carried on, and there are several breweries. It is near a railway, which connects it with Bruges and other places. Pop. 8,300.

MEURSIUS, or DE MEURS, JOHANNES, 1579–1639; b. Belgium; educated at Leyden, where he became famous for his classical attainments. At the age of 12 he wrote orations in Latin, at 13 he composed Greek verses, and at 16 he had finished a commentary on Lycophron, the most difficult Greek author. On leaving the university he became tutor to the sons of John of Barneveldt, the grand pensionary, and traveled with them through Europe. He continued his studies on the continent, and the university of Orleans recognized his great learning by conferring upon him the degree of LL.D. He returned to Holland in 1610, and became professor of history in the academy of Leyden, and the next year was transferred to the chair of Greek. He was made historiographer to the states of Holland, and enjoyed a high degree of favor, till the execution of Barneveldt, his known intimacy with whom exposed him to considerable persecution. He was offered and accepted, in 1625, from the king of Denmark, the professorship of history in the university of Sora, and the position of royal historiographer, and he remained at Sora till his death. His published works are 67 in number; they include editions of many Greek authors, such as Lycophron, Procopius, Porphyry, and Aristoxenes; treatises on Greek and Roman antiquities; and a *Glossarium Græco-Barbarum*, still a standard work on the Greeks of the lower empire.

MEURTHE, formerly a department in the n.e. of France, immediately s. of the former department of Moselle. The area was about 2,254 sq.m.; pop. '66, 428,387. Its surface is undulating and picturesque; while along the eastern border run the Vosges mountains, rising in one point to 1148 ft. in height. The chief rivers are the Moselle, and its affluents the Meurthe, the Madon, the Seille, etc. This district is no less remarkable for the beauty of its scenery than for the fertility of its soil and the variety of its productions. After the treaty of Frankfort, by which part of Meurthe was ceded to Germany, the rest of Meurthe, together with the small part of the department of Moselle that remained to France, was formed into a new department under the name MEURTHE-ET-MOSELLE; area, 2,015 sq.m.; pop. '76, 404,609. Arrondissements: Nancy, Lunéville, Toul (from Meurthe), and Briey (from Moselle); capital, Nancy.

MEUSE, a river of northern Europe, rising in the department of *Haute Marne* in France, flowing northerly through the departments of Vosges, Meuse, and Ardennes, traversing the mountainous region of the "forest of Ardennes," entering Belgium at Namur, where it is joined by the Sambre from the w.; thence runs n.e. past Liége, where it receives the Ouerthe, forms a part of the boundary between Belgium and Holland, passes Maestricht and Roermond, and receives the Roer. At Bommel it almost joins the Rhine, and finally mingles its waters by two channels with the Waal, one of the mouths of the Rhine, the easterly channel reaching Rotterdam, and afterwards being joined by the other, when both empty into the North sea. Their delta forms extensive shoals and quicksands. The river is 580 m. long, and can be navigated 460 miles. Canals in Holland and Belgium connect it with their other rivers.

MEUSE, a frontier department in the n.e. of France. Area, 2,400 sq.m.; pop. '76, 294,054. The surface is traversed from s.e. to n.w. by two parallel ranges of hills, which form the right and left bank of the river Meuse (see MAAS), and separate it from the basin of the Seine on the w., and from that of the Moselle on the east. The Meuse, the Ornain, and the Aire are the chief rivers. The soil is generally poor, except in the valleys of the principal rivers, which are remarkably fertile and well cultivated. The usual crops are raised in average quantities. Twenty-two million gallons of wine (red and white) are made annually. The four arrondissements are Bar-le-Duc, Commercy, Montmédy, and Verdun. The capital is Bar-le-Duc.

MEW, or SEA MEW, the English name for the common European gull (*larus canus*) and other small gulls.

MEXICO constitutes the south-west extremity of North America, and occupies a portion of the isthmus which connects the latter with the s. part of the American continent. It is bounded on the n. by the territories of the United States, on the w. by the Pacific ocean, on the s. by the Pacific and Central America, and on the e. by the gulf of Mexico. The area of Mexico is about 750,000 sq.m., and the pop. (1878) about 9,340,000. In 1861 the 8,000,000 inhabitants were thus distributed amongst the various races: Indians, 4,800,000; whites, 1,004,000; half-breeds, 1,190,000; negroes, 6,000. The following table gives the names of the provinces and their chief towns, with the populations for 1869:

States.	Pop. in 1869.	Chief Towns.	Population.
Aguas Calientes	140,630	Aguas Calientes	22,534
Campeachy	80,366	Campeachy	15,196
Chiapas	193,187	San Cristobal	10,475
Chihuahua	179,971	Chihuahua	12,000
Coahuila	95,397	Saltillo	8,105
Colima	63,333	Colima	31,000
Durango	185,077	Durango	12,449
Guanajuato	874,043	Guanajuato	63,000
Guerrero	300,029	Tixtla	6,501
Hidalgo	404,207	Pachuca	12,000
Ialisco	924,580	Guadalajara	70,000
Mexico	650,633	Toluca	12,000
Michoacan	618,240	Morelia	25,000
Morelos	150,384	Cuernavaca	.....
Nuevo Leon	174,000	Monterey	13,500
Oajaca	646,725	Oajaca	25,000
Puebla	697,788	Puebla	75,500
Queretaro	153,286	Queretaro	47,570
San Luis Potosi	477,500	San Luis Potosi	33,581
Sinaloa	163,095	Culiacan	10,000
Sonora	109,388	Ures	7,000
Tabasco	83,707	San Juan Bautista	6,000
Tamaulipas	108,778	Ciudad Victoria	6,164
Tlaxcala	121,665	Tlaxcala	4,000
Vera Cruz	459,262	Vera Cruz	10,000
Yucatan	422,365	Merïda	23,500
Zacatecas	397,945	Zacatecas	31,000
Federal District	275,996	Mexico	200,000
California	21,645	La Paz	500

Physical Character, etc.—The great mass of the Mexican territory consists of an elevated plateau, formed by an expansion of the Cordilleras of Central America (q.v.), from which terraced slopes descend with a more or less rapid inclination towards the Atlantic on the e. and the Pacific on the west. This vast tract, which extends from 18° to 32° n. lat., and from 95° to 115° w. long., comprises one of the richest and most varied zones in the world; for while its geographical position secures to it a tropical vegetation, the rapid differences of elevation which characterize it afford it the advantages of temperate climates, in which all the varieties of our European flora and fauna can come to perfection; and it thus combines within its limits an almost unparalleled exuberance and multiplicity of natural products. The table-lands of Mexico lie at elevations varying from 5,000 to more than 9,000 ft. above the level of the sea, and exhibit great differences of level and varieties of soil. They generally incline northward, and are for the most part girt in by low mountain chains, among which rise individual lofty peaks, as Coffre de Perote (13,400 ft.), Orizava (17,370 ft.), and others; while they are intersected by higher ranges, above which tower a few cones, as Istaccihuatl, the white woman (15,700 ft.), and the volcano of Popocatapetl, or the smoking mountain (17,880 feet). These volcanoes and several others of less note, lying within the parallels of 18° 15′ and 19° 30′ n. lat., form a transverse volcanic band between the two oceans, and do not follow the inclination of the central chain, as is the case in the volcanoes of South America. Volcanoes also occur isolated, as, for instance, in the plain of Mixtecapan, 2,900 ft. above the sea, where, in 1759, the volcano of Jorullo, which still emits smoke, was formed after an eruption, by which a surface of many square miles was raised several feet above the level of the plain; in fact, every part of the Mexican territory betrays the volcanic nature of its formation, although neither earthquakes nor any other active phenomena have of late been of frequent occurrence. The principal chain, intersecting the table-land, is the Sierra Madre, or Tepe Suene, in which lie the chief gold and silver mines, and which, after traversing the states of Queretaro and Guanajuato, divides into three main branches, the central of which forms the water-shed between the Pacific ocean and the gulf of Mexico. In addition to these great chains, the Mexican territory is intersected by numerous lesser ranges, which on the Pacific side break up the terraced declivities into innumerable deeply cleft valleys, which assume almost the character of steep ravines near their junction with the narrow littoral plains of the Pacific ocean. Violent storms rage on this coast, blowing from the south-west during the hot months, when the climate is as prejudicial to whites as on the Mexican gulf, although it is not visited by the yellow-fever. Mexico may be said to be generally deficient in navigable rivers; for although some of the largest have a course of more than 1000 miles, few are free from rapids. The Rio Santiago, or Rio Grande, with a course of 500 m., is

broken near Guadalajara by 60 falls in the space of less than three miles; the Rio Grande del Norte, which forms in its lower course the boundary between Mexico and the United States, has a winding course of nearly 1800 m., but it is only navigable for small sailing vessels to Matamoras, 60 m. from its mouth, where a bar and numerous shoals prevent the passage of large vessels. A similar remark applies to the majority of the rivers which fall into the gulf of Mexico. The eastern coast generally presents great obstacles to navigation, as it is low and sandy, unbroken by bays or inlets, and lined by sandbanks several miles in width; the only points of access being the mouths of rivers, which are not good roadsteads, as with few exceptions, the rivers have little water, except at the rainy season, which generally sets in about June, accompanied by overpowering heat, during the prevalence of which the yellow-fever, or *vomito prieto*, rages like a pest in all the low lands. Mexico is on the whole badly supplied with water; and since the Spaniards have discontinued the system of irrigation, which was followed by the Aztec races with so much success, many tracts have become barren, and unsuited for the purpose of human occupation. A great portion of the table-lands can only be used for pasture. Springs are rare, and many of the rivers flow in deep mountain beds, without receiving smaller tributaries, while the rapid evaporation on a light soil, covering porous rocks, leaves the surface dry and hot, and unable to support any vegetation, beyond the cactus and some low grasses. The plains, moreover, contain the beds of numerous dry salt lakes, but this is chiefly the case on the north and east of the table-land. The western parts of the plateaux between 100° and 102° w. long. (known as the Baxio), yield, by careful irrigation, rich crops of maize and wheat, and rank among the most fertile agricultural districts of Mexico. They are, however, here and there interrupted by sterile tracts, either covered by stones, and then known as "pedegral," or with lava, when they are characterized as a *mal pais* (bad country). In contrast with these unprofitable districts, the plains are occasionally broken by depressions of the soil, known as *barrancas*, descending sometimes 1000 ft., and measuring several miles across, which are covered with a luxuriant vegetation of trees and shrubs, and watered by small streams running through the middle of the valley. Mexico has numerous lakes, but few of any importance; that of Chapala in Jalisco is one of the most considerable, being more than 90 m. long.

Climate, Products.—The differences of climate, depending upon the different degrees of altitude, are so great in Mexico that the vegetable products of this vast country include almost all that are to be found between the equator and the polar circle. In the course of a few hours, the traveler may experience every gradation of climate, embracing torrid heat and glacial cold, and pass through different zones of vegetation, including wheat and the sugar-cane, the ash and the palm, apples, olives, and guavas. The Spaniards, on their first occupation of Mexico, distinguished its great climatic divisions under the characteristic names, which are still retained, of the *tierras calientes* (hot or littoral lands), *tierras templadas* (temperate lands), and *tierras frias* (cold or high lands). The mean annual heat of the tierras calientes is 77°; and the soil, which is generally fertile, produces maize, rice where water can be procured for irrigation, bananas, pine-apples, oranges, manioc; and sarsaparilla, jalap, and vanilla in the littoral swampy forests. This tract has only two seasons—the winter, or season of north winds, and the summer, or season of breezes. In the former, the hurricanes are the terror of navigators, but the coast is clear of yellow-fever, which prevails in the hot season. On the medium elevations of the tierras templadas, the temperature is extremely equable, varying only from about 70° to 80° F.; the climate healthy, and wherever water is abundant, a perpetual summer reigns, yielding a varied and active vegetation, which embraces all the cereals, fruits, and vegetables of central and southern Europe, amongst which maize, oranges, lemons, grapes, and olives are produced in the most exuberant abundance. The tierras frias, which would scarcely have been characterized as cold by discoverers belonging to a less southern climate than Spain, possess a generally temperate climate, the mean annual heat ranging between 66° and 68° F.; but on the highest of the table-lands, the air is keener, and the soil more arid, and agriculture is limited to the cultivation of barley and of the agave, or Mexican aloe, which held the place of the vine among the ancient Aztecs, and is still extensively cultivated for the sake of its juice, which is made into the fermented drink known under the name of *pulque*. In addition to the vegetable products already referred to, Mexico yields coffee, tobacco—whose growth is, however, limited by governmental restrictions—yams, capsicums, pepper, pimento, indigo, ipecacuanha, dragon's-blood, copaiva, fan-palms, india-rubber trees, mahogany, rosewood, ebony, etc.

The products of the mines, which rank among the richest in the world, include the precious metals. The gold mines of Mexico occur principally on the w. side of the Sierra Madre, n. of 24° n. lat., and, until the discovery of the metal in Australia, their yield surpassed the produce of any other part of the world. Silver mines abound in Mexico, and the argentiferous veins, which may be said to intersect every part of the western declivities of the Andes, occur in some places, as in the *Vela Madre* lode at Guanajuato, in beds varying from 10 to 50 yards in depth; the precious metal being in these cases intermixed with sulphur compounds, antimony, and arsenic. But although these mines possess the additional special advantage of being situated in fertile districts, affording abundant food to miners and their cattle, their working has been very imper-

fectly carried on, owing to the unsettled state of the country. At the close of the last, and the beginning of the present century, the annual value of the gold and silver of Mexico was upwards of £6,000,000, of which nine-tenths were yielded by the silver; but the political disturbances, preceding and consequent on the wars of independence, have very considerably reduced this sum, which has probably never been reached since Mexico was finally separated from the mother-country. In addition to gold and silver, Mexico yields tin, antimony, mercury, copper, lead, iron, and zinc; while carbonate of soda, used in smelting silver, is found crystallized on the surface of several lakes, and occurs, together with common salt, in dry seasons, on the more arid parts of the surface of the elevated table-lands.

Cattle, horses, asses, mules, and sheep abound in Mexico, where, in consequence of the extent and excellence of the pasture-grounds, all the domestic animals introduced from the old world have multiplied excessively. Buffaloes feed in the lower plains; goats and sheep are plentiful; the tapir, wolf, American lynx, jaguar, wild cat, several species of the skunk, the brown porcupine, stag, deer, etc., are to be found. Parrots, humming-birds, and wild game birds, including turkeys, are abundant; and almost all the lakes yield large quantities of fish. The cochineal insect and the silk-worm are reared with great success on the table-land of Mixtecapan.

Commerce, etc.—Notwithstanding the enormous advantages presented by her natural productions, and the important geographical position which she occupies between the Atlantic and the Pacific, Mexico, owing to her unsettled government, and the consequent insecurity of life and property, has not been able to develop her foreign commerce beyond the value of about £10,000,000. The precious metals constitute, it is estimated, nearly nine-tenths of the exports, the remainder being made up by productions of the soil, and industrial products, such as cotton, woolen and silk goods, soap, leather, saddlery, gold and silver lace, cigars, brandy, etc. England, France, Hamburg, and Lubeck, and the United States, are the principal powers with which Mexico maintains relations of foreign commerce; while the city of Mexico is the chief focus of internal trade, and Vera Cruz the principal port for maritime commerce. The total value of the foreign trade of Mexico in 1876 was—for imports, £5,600,000; for exports, £5,100,000. For the number of ships entering and clearing the ports of Mexico, see VERA CRUZ and TAMPICO. Mexico possesses about 400 m. of railway, the line from Vera Cruz to Mexico being one of the most wonderful pieces of engineering enterprise in the world. The annual traffic amounts to about 250,000 passengers, and 190,000 tons of freight. The financial condition of Mexico has been allowed to fall into such disorder since the establishment of independence that the expenditure has been continually increasing beyond the receipts. According to the printed estimates, the estimated amount of the budget for 1875–76 was £4,760,000. The total expenditure for the same year was estimated at £4,980,000. The revenue is derived mainly from the customs. The total amount of the national debt cannot be stated. The loans contracted by the imperial government are entirely repudiated by the present government.

Army, Navy, etc.—In accordance with the old constitution of Mexico, the standing army was to consist of 26,000 men, with a reserve of 65,000 men; but this number, which had fallen to nearly half the required force in 1855, has been so extensively reduced since that period by continual civil wars, that, according to Spanish authorities, the government of the late president Juarez, on the breaking out of hostilities with the French in 1862, was unable to bring into the field more than 5,000 infantry, 800 cavalry, and 9,500 of the national guard. The total strength of the army is now estimated at about 20,000 men. The navy consisted of only some 300 men, while the fleet numbered only 9 small ships of war, carrying in all between 30 and 40 cannon. Education in Mexico, long in the lowest possible condition, even among the wealthier classes, is now steadily improving. Liberal allowances have been made by the central and state governments for establishment of new schools, etc. In 1873 there were in Mexico nearly 4,000 public schools, with about 190,000 scholars.

Religion, etc.—The Roman Catholic is the dominant church of Mexico, but all other sects are tolerated. Mexico has 3 archbishops and 10 bishops. The administration of justice is not what it should be, but is not so inefficient, nor the courts so corrupt, as formerly. Brigandage and smuggling endanger personal security, and seriously damage the resources of the nation, but are gradually disappearing.

The supreme power of the state was, in 1858, vested in the hands of Benito Juarez, who was to bear the title of constitutional president, and administer public affairs in conjunction with a legislative congress, composed of a chamber of senators and lower house of representatives. Each province was to elect two senators and one deputy to every 40,000 inhabitants, and was, moreover, to have a separate provincial legislative chamber, presided over by its governor. President Juarez is undoubtedly, along with gen. Iturbide, to be regarded as the most distinguished character in modern Mexico. The unfortunate Maximilian was a mere episode in the career of the country. A provisional regency of the Mexican empire was appointed by the *Junta Superior del Gobierno;* which was itself constituted (June 16, 1863) by a decree of marshal Forey, leader of the French army of invasion. It was composed of 35 members. This junta at the same time established, under French influence, an *assembly of notables,* whom it charged with deciding in the name of the people what form of government Mexico should adopt.

On July 10, 1863, this body, by an overwhelming majority, decided in favor of a constitutional hereditary monarchy, and that the new ruler should bear the title of emperor of Mexico. See succeeding article. The present constitution dates from 1857. The executive power is vested in a president, elected by universal suffrage, for a period of 6 years. The legislative power is confided to a congress consisting of a house of representatives (one for each 80,000 inhabitants), and a senate (with two members for each state).

History of Mexico.—The history of ancient Mexico exhibits two distinct and widely differing periods, the former of which, that of the Toltecs, appears to have begun in the 7th and ended with the 12th c.; while the second, that of the Aztecs, began in the year 1200, and may be said to have been closed by the conquest of Cortes in 1519; for although the race has maintained occupation of the Mexican territory, its existence as a nation ceased with the Spanish domination. The origin and primitive seats of the Toltecs are shrouded in mystery; and all that we learn of this people is, that they came from the north, from some undefined locality, which they designated Tullan, and from whence they brought to the valley of Mexico the first elements of civilization. Their laws and usages stamp them as a people of mild and peaceful instincts, industrious, active, and enterprising. They cultivated the land, introduced maize and cotton, made roads, erected monuments of colossal dimensions, and built temples and cities, whose ruins in various parts of New Spain still attest their skill in architecture, and sufficiently explain why the name Toltec should have passed into a synonym for architect. They knew how to fuse metals, cut and polish the hardest stones, fabricate earthenware, and weave various fabrics: they employed hieroglyphics for the record of events, were acquainted with the causes of eclipses, constructed sun-dials, devised a simple system of notation, and measured time by a solar year, composed of 18 months of 20 days each, adding 5 complementary days to make up the 365, and intercalating 12¼ days at the expiration of every 52 years, which brought them within an almost inappreciable fraction to the length of the tropical year, as established by the most accurate observations. These and other arts, with a mild form of religion, and a simple but just mode of administering the laws, the Toltecs bequeathed to the Aztecs, who engrafted upon the civilization of their predecessors many fierce and sanguinary practices in their religious, and many puerile usages in their social life. Nothing is known of the exact time, and still less of the manner and causes of the departure of the Toltecs from Mexico; but it has been conjectured that they went towards the south, and that the colossal architectural remains of the cities of Palenque, Uxmal, and Mitla, in Central America, are the work of their hands. The Aztecs, as we have said, imparted to the institutions of the Toltecs a tinge of their own somber cruelty, and produced an anomalous form of civilization, which astonished the Spaniards by its mingled character of mildness and ferocity. Like the Toltecs and the Chichmecs, a rude tribe who had succeeded them, the Aztecs came from the north, and after wandering from place to place, founded in 1325 the city of Tenochtitlan, or Mexico. On the arrival of the Spaniards, their empire was found to extend from ocean to ocean, stretching on the Atlantic from 18° to 21° n. lat., and on the Pacific from 14° to 19° n. lat. Their government was an elective empire, the sovereign being selected from the brothers of the deceased prince, or, in default of them, from his nephews. Their laws were severe, but justice was administered in open courts, the proceedings of which were perpetuated by means of picture-written records.

The Aztecs believed in one supreme invisible creator of all things, the ruler of the universe, named Taotl—a belief, it is conjectured, not native to them, but derived from their predecessors, the Toltecs. Under this supreme being stood 13 chief and 200 inferior divinities, each of whom had his sacred day and festival. At their head was the patron god of the Aztecs, the frightful Huitziiopochtli, the Mexican *Mars*. His temples were the most splendid and imposing; in every city of the empire his altars were drenched with the blood of human sacrifice. Cortes and his companions (see DIAZ) were permitted by Montezuma to enter that in the city of Mexico, and to behold the god himself. "He had a broad face, wide mouth, and terrible eyes. He was covered with gold, pearls, and precious stones; and was girt about with golden serpents. . . . . On his neck, a fitting ornament were the faces of men wrought in silver, and their hearts in gold. Close by were braziers with incense, and on the braziers 3 real hearts of men who had that day been sacrificed" (Helps's *Spanish Conquest in America*, vol. ii., book x., chap. 4). The smell of the place, we are told, was like that of a slaughter-house. To supply victims for these sacrifices, the emperors made war on all the neighboring and subsidiary states, or in case of revolt in any city of their dominions, and levied a certain number of men, women, and children by way of indemnity. The victims were borne in triumphal processions and to the sound of music, to the summit of the great temples, where the priests, in sight of assembled crowds, bound them to the sacrificial stone, and opening the breast, tore from it the bleeding heart, which was either laid before the image of their gods, or eaten by the worshipers, after having been carefully cut up and mixed with maize. In the years immediately preceding the Spanish conquest not less than 20,000 victims were annually immolated. These atrocities were incongruously blended with milder forms of worship, in which fruits, flowers, and perfumes were offered up amid joyous outbursts of song and dance. According to their mythology, Taotl, who delighted in these purer sacrifices, had once reigned in Anahuac (a name which at first probably applied only to the country in the immediate vicinity of

the capital, though afterwards it was applied to the whole Aztec empire) in the golden age of the world, but being obliged, from some unexplained cause, to retire from earth, he departed by way of the Mexican gulf, promising to return. This tradition accelerated the success of the Spaniards, whose light skins and long dark hair and beards were regarded as evidences of their affinity with the long-looked-for divinity. The Mexican priesthood formed a rich and powerful order of the state, and were so numerous that Cortes found as many as 5,000 attached to the great temple of Mexico. The education of the young of both sexes remained till the age of puberty in the hands of the priests and priestesses; and the sacerdotal class were thus able to exercise a widely-diffused influence, which, under the later rulers, was almost equal to that of the emperor himself. The women shared in all the occupations of the men, and were taught, like them, the arts of reading, writing, ciphering, singing in chorus, dancing, etc., and even initiated in the secrets of astronomy and astrology.

On the arrival of Cortes in 1519, the Aztec throne was occupied by Montezuma, an energetic prince, who, after his election to the throne, which for several generations had been occupied by his ancestors, made successful war on the powerful and highly-civilized neighboring state of Tlascala, and on Nicaragua and Honduras; after a time, however, he grew indolent, and alienated the affections of his subjects by his arrogance and exactions, and by his unremitting devotion to the services of the temples. According to the oracles which he frequently consulted, great changes were impending over the empire, the return of Quetzalcoatl was near at hand, and the fall of his race was impending. The tidings of the arrival on the coast of the expedition of Grigalva in 1518 terrified Montezuma and his priestly councilors; and when the hieroglyphic reports of his provincial officers announced the landing in the following year of Cortes and his companions, he endeavored to propitiate the dreaded strangers by sending an embassy charged with valuable gifts to meet them. The road to success was thus open to the Spanish captain, who, with a handful of men, advanced from St. Juan de Ulloa to Mexico, and gradually subdued the entire empire of the Aztecs, whose power crumbled to dust before the greater energy and superior civilization of their Christian invaders. In 1540 Mexico was united with other American territories under the name of New Spain, and governed by viceroys appointed by the mother-country. The intolerant spirit of the Catholic clergy led to the suppression of almost every trace of the ancient Aztec nationality and civilization, while the strict system of sequestration enforced in Mexico crippled the resources of the colony; yet notwithstanding these drawbacks, Mexico ranked first among all the Spanish colonies in regard to population, material riches, and natural products. It may be said to have vegetated for nearly three centuries in a state of semi-quiescent prosperity, interrupted by few disturbances of any kind until the year 1810, when the discontent, which had been gaining ground against the vice-regal power during the war of the mother-country with Napoleon, broke into open rebellion under the leadership of a country priest named Hidalgo. The defeat and subsequent execution of the latter in 1811 put a partial stop to the insurrection; but the atrocities committed under the sanction of the new viceroy, Calleja, exasperated the people, and gave an irresistible impulse to the revolutionary cause. Guerrero and Iturbide in turn gained signal advantages over the Spaniards. For a time Iturbide maintained a self-established imperial rule over the colony; but on the downfall consequent on his tyrannical abuse of power, a constitutional mode of government was inaugurated, and in 1824 the independence of Mexico, which had chosen a federal republican form of government, was finally established, and in the following year definitely recognized by every foreign power except Spain. The Mexican war was stained with excesses and atrocities on both sides; but it must be confessed that the Spaniards gained an unenviable pre-eminence in regard to the wanton cruelty which characterized their method of conducting hostilities. With them the war was one of extermination, every commander being allowed, at his own discretion, to hunt down and slaughter the insurgents like brutes.

The welfare of the new republic was unhappily disturbed by constant outbreaks of civil war under the leadership of the escosses, or aristocratic faction, and the yorkinos, or democrats; and the history of the quarter of a century during which Mexico has exercised independent power, leaves little to recount beyond ever-recurring acts of violence, and the rapid and summary deposition of one president after another. In 1836 Texas secured its independence of the Mexican republic, for which it had struggled for several years, and at the same period differences arose with France, which were, however, brought to a peaceful conclusion after the taking of Vera Cruz in 1838 by the French troops. In 1841 gen. Santa Anna, on the retirement of Bustamente, succeeded in regaining the direction of affairs, from which he had been more than once deposed, and, under the title of dictator, exercised the power of an autocratic ruler. In 1845 Mexico was compelled to recognize the independence of Texas, which was incorporated with the United States, whose troops having entered the Mexican territory, provoked a declaration of war on the part of the Mexican government. Hostilities were carried on with great energy by both parties until 1848, when peace was finally concluded, after several bloody engagements had been fought without any definite result on either side; and the city of Mexico had been stormed and taken by the Americans under gen. Scott. In 1852, after Santa Anna and Herrera had been in turn deposed and recalled to power,

a revolutionary movement of more than ordinary importance brought gen. Cevallos for a time to the head of affairs; but, when the insubordination and arrogance of the soldiery threatened universal anarchy, Santa Anna was again recalled, Mar. 17, 1853. Having reorganized the army, and suppressed by the most cruel severity the insurrection of the federals, he declared himself president for life, and thus again rekindled civil war. In 1855 he had to flee from the country. Since then, utter confusion has prevailed. Santa Anna was succeeded by gen. Alvarez, who held office for about two months, after whom came gen. Comonfort, who was forced to resign in 1858; when a gen. Zulvago assumed supreme power, but was almost immediately deposed by a gen. Robles. This person also proving a futility, Benito Juarez was elected; but his claims were contested by gen. Miramon—the head of the priestly and conservative party—and the country was plunged in civil war. The acts of wanton aggression and flagrant injustice perpetrated on foreigners in Mexico during this period of internal disorder, during which the cortes passed an act suspending all payments to foreigners for two years, could not fail to draw upon the Mexican government the serious remonstrance of those European powers whose subjects had just cause of complaint; and the result was to bring a fleet of English, French, and Spanish ships into the Mexican gulf for the purpose of enforcing satisfaction. In Dec., 1861, the British minister left Mexico, and the Spaniards disembarked a force at Vera Cruz, and took possession of the fort of St. Juan d'Ulloa, a step which was soon followed by the arrival before the former city of the allied fleet. A proclamation, signed by the commanders-in-chief of the three naval divisions, and addressed by them to the Mexican people, elicited no satisfactory reply; and steps were accordingly taken to advance at once upon the capital. This measure alarmed the provisional government of Mexico, and brought about an armistice, with a view of negotiating a treaty for the future regulation of commercial intercourse between Mexico and the great European powers. This treaty was drawn up and provisionally ratified by the different commanders, but not confirmed on the part of France, and consequently the French troops retained occupation of the Mexican territory after the English and Spaniards had declined to join in further hostile demonstrations. In April, 1862, the French emperor formally declared war against the government of Juarez, who had assumed arbitrary rule as president of the republic. The French, who spent £8,000,000 on the Mexican expedition, did not meet with the sympathy and welcome from the people at large which the assumed unpopularity of Juarez had led them to anticipate; and, although the taking of Puebla and other decided successes gave them a firmer footing in the country, it was evident that whatever grievances the Mexican nation had against their government, they entertained a deeply rooted hatred against foreigners, and were certainly not prepared to welcome with cordial unanimity the thorough reorganization of their political system which the European powers, with France at their head, were initiating for the country.—Comp. *Le Mexique, Ancien et Moderne*, par Michel Chevalier (Hachette, 1863).

MEXICO. [*From Supplement.*] After the declaration of war against Juarez by the French, they issued a proclamation to the Mexican people, April 16, 1862, setting forth that one of the objects of the contest was to rescue them from the tyranny of the president, and put the government of the country on a stable footing. Little faith, however, seems to have been put in these professions; and the invaders, though joined by Marquez, the military leader of the clerical party, met with little success till the arrival of gen. Forey with a reinforcement from France in September. Forey then took the command in chief, addressed a proclamation to the Mexicans, promising them perfect liberty in the choice of a new government in room of that of Juarez; and in the spring of 1863 concentrated the French troops, and marched on Mexico. On his way he took the strongly fortified city of Puebla after a two months' siege, capturing its defender, Ortega, and his whole force (May 18); and, Juarez having fled from the capital, and transferred the seat of his government to San Luis Potosi at their approach, the French entered Mexico on June 10. A fortnight afterwards, a provisional government, headed by gen. Almonte, was established, and an "assembly of notables," which was called (June 24) to deliberate upon the best form of government, decided in July, by a vote of 231 to 19, in favor of a "limited hereditary monarchy," with a Catholic prince for sovereign, under the title of "emperor of Mexico," and resolved in the first place to offer the crown to the archduke Ferdinand *Maximilian* (q.v.) of Austria, failing whom, to request the good offices of the emperor Napoleon in obtaining another monarch. That this resolution was the fruit of a general earnest wish on the part of the Mexican notables, the feeble and almost unwilling support most of them accorded to their chosen emperor after his desertion by the French, will not allow us to suppose; but, on the other hand, we have not the slightest reason for believing that anything approaching intimidation or undue influence was exercised by the French. Most of them doubtless argued that a government supported by France would be sufficiently powerful to maintain the country in a state of tranquillity, and in the hope of this long wished-for result, cast in their lot for empire. These changes were, of course, vigorously protested against by the republican assembly at San Luis, and the two parties prepared with eagerness to try the fortune of war. On Oct. 1 Forey departed from Mexico, and gen. Bazaine took the command of the French forces, and commenced the campaign with vigor. The result of the winter's struggle

was that in spring the imperialists were in possession of the whole country, with the exception of the four northern provinces. On Oct. 3, 1863, the archduke Maximilian had given audience at his château of Miramar, near Trieste, to a deputation which was sent to offer him the crown, and had accepted it. On May 29 the emperor and empress landed at Vera Cruz, and on June 12 made their public entry into the capital; and soon after the middle of the year the imperialists had gained possession of every state in the kingdom, Juarez fleeing in August to the United States. As small parties of the republicans still maintained a species of guerrilla warfare in various districts, Maximilian, on Oct. 2, 1865, published a proclamation, menacing with death, according to the laws of war, all who were found in armed opposition to his government; the republic having ceased, not only by the express wish of the nation, but also by the expiry (Nov. 22, 1864) of Juarez's term of office, and his flight beyond the frontiers; an amnesty, however, being accorded to such as submitted before Nov. 15. In accordance with this edict, gens. Arteaga and Salazar, who were defeated and captured Oct. 13, were shot on the 21st; and many hundreds of captured republicans were dealt with under the terms of the same order.

This contest in Mexico had from the commencement excited the liveliest interest in the United States, though the civil war, raging there also, prevented any active interference in the affairs of its neighbor. A general impression existed that France had taken advantage of the troubles of the United States to establish its authority firmly on the American continent; and this belief, along with the violation of the "Monroe doctrine" by the establishment of imperialism in Mexico, induced the United States to give all their sympathy and diplomatic aid to Juarez and his supporters. In Nov. 6, 1865, secretary Seward forwarded a dispatch to Paris, in which it was stated that the presence of the French army in Mexico was a source of "grave reflection" to the government of the United States, and that the latter could on no account allow the establishment of an imperial government, based on foreign aid, in Mexico, or recognize in that country other than republican institutions. This dispatch led to an interchange of diplomatic notes during the following six months; the Americans holding firmly to their first statements, and even insinuating the probability of an armed interference on behalf of Juarez; till the French emperor, who was wearied with a contest so expensive and, though successful, so barren of lasting fruits, ultimately agreed, in the summer of 1866, to withdraw his troops from Mexico. The Belgian legion and some Austrian levies, however, were not included in this arrangement. Accordingly, from the autumn of 1866 till Feb., 1867, the French troops by degrees evacuated Mexico, and their departure was the signal for a fresh rising on the part of the Juarists. See MAXIMILIAN and JUAREZ. Since 1871 Mexico has remained a republic; but it has repeatedly been disturbed by rebellion and civil war.

MEXICO (*ante*). Juarez, president of Mexico until 1872, was succeeded by Lerdo de Tejada (q.v.), under whose administration the country remained in a satisfactory condition. This statesman was minister of foreign affairs under Juarez, and his ability as a diplomatist was well recognized. The perpetual tendency to revolt which characterizes the Mexican people, though smothered during the presidency of Lerdo, became active toward the end of 1876; and his re-election for four years precipitated a revolution, headed by Porfirio Diaz, by which the latter gained control of the government, while Lerdo and his cabinet fled. President Diaz remained in possession of the government until 1880, when the regular quadrennial election resulted in the success of the government candidate, gen. M. Gonzalez, who was declared president; he had been secretary of war in 1878. A few revolutionary outbreaks which occurred during president Diaz's administration were promptly suppressed, through the employment of vigorous measures by the government.—A table published in Mexico in 1876 (not entirely trustworthy) gives the pop. of the republic as 8,743,000, and that of the city of Mexico as 250,000. The republic is divided politically into 27 states, one federal district, and one territory. The names of the states are as follows: Aguas Calientes, Campeachy, Chiapas, Chihuahua, Coahuila, Colima, Durango, Guanajuato, Guerrero, Hidalgo, Jalisco, Mexico, Michoacan, Morelos, Nuevo Leon, Oajaca, Puebla, Querétaro, San Luis Potosi, Sinaloa, Sonora, Tabasco, Tamaulipas, Tlaxclala, Vera Cruz, Yucatan, and Zacatecas. Each of these states is administrated over by a governor, and an assembly called the state congress. The army of the republic comprised, in 1879, 20 battalions of foot, 14,640 men and 765 officers; 10 corps of horse, 4,840 men and 290 officers; 4 brigades, of 4 batteries each, of artillery, 1315 men and 148 officers; coast-guards, 71 men and 22 officers; and invalids, 265 men and 19 officers; total, 22,375. The annual expenses of the Mexican army and navy (the latter comprising only 4 gun-boats) average over $8,000,000.—The national debt of Mexico was set down in 1878 at $131,914,665; of which, to Great Britain, $69,311,657; to Spain, $9,460,986; to France, $2,859,917: interest, $57,392,145; miscellaneous (including American claims awards $3,375,123), $6,121,753. The annual revenue is about $17,000,000; the annual expenditure about $19,000,000. The total amount of the exports varies between $25,000,000 and $35,000,000 annually, that of the imports being about the same, though the prevalence of smuggling renders it impossible to more than approximate to the correct figures. The amount of the trade of Mexico

with the United States is only attainable in part from the published reports, as given in the following table.

TRADE BETWEEN MEXICO AND THE UNITED STATES (IN PART) FOR 1878.

	Imports.	Exports.
Vera Cruz		$1,587,916 29
Mazatlan	$1,182,987 00	2,398,493 00
Matamoras	865,011 00	476,831 00

At the close of the year 1879 there were 372 m. of railroad in operation in Mexico, the principal line being that between Vera Cruz and the capital. Education was conducted, in 1876, in the republic by 8,103 primary schools; 54 professional and secondary schools; a national preparatory school in the city of Mexico; and other institutions of learning. There were also 40 public libraries; 3 of which, containing an aggregate of 236,000 volumes, were in the capital. The important staple articles of export are mahogany and dye-woods, cochineal, tobacco, coffee, sugar, and the hennequen plant (*agave Americana*), from which is prepared Sisal hemp. During the year 1875–76 Yucatan produced 22,000,000 lbs. of this fiber, representing the product of more than 18,000,000 plants under cultivation. The capital invested in this industry was $5,147,000. Maize is largely cultivated, and yields three and sometimes four crops annually; but, with wheat and rice, is only grown for home consumption. The value of the exportation of tobacco in 1873 amounted to $132,984.75.

MEXICO, or MEJICO, the capital city of the republic, is situated in 19° 20′ n. lat., and 99° 5′ w. long., at an elevation of nearly 7,500 ft. above the level of the sea, in the valley of Tenochtitlan, 2½ m. w. of lake Tezcuco. The pop. was, in 1878, 230,000. This beautiful city, which is built on the site of the ancient Tenochtitlan of the Aztec empire, is situated on an extensive plateau, having an area of more than 1700 sq.m., surrounded by lofty mountains, and including 5 lakes within its area. The principal streets, which all converge towards the great square of Mexico, are regularly and well laid-out, broad, clean, and well-paved and lighted; but the buildings, both private and public, are low, and of a light style of architecture, in consequence of water being found in many parts of the city at only a few feet below the surface, and partly from apprehension of earthquakes. The plaza mayor, one of the finest squares of the western world, contains the cathedral, a spacious and imposing building, erected on the ruins of the great *teocalli*, or temple of the Aztec god Mixitli, and adorned with the *kellenda*, a circular stone, covered with hieroglyphics, by which the Aztecs used to represent the months of the year. The palace of the cortes, in the same square, consists of various buildings appropriated to offices of state, government schools, and public institutions of various kinds, but like everything else in Mexico, has been suffered gradually to fall to decay since the evacuation of the Spaniards. Mexico contains 14 churches, some monasteries and convents, and numerous charitable institutions; the fine hospital has been converted into a barrack. There are schools of jurisprudence, medicine, agriculture, engineering, and an academy of the fine arts, containing valuable Aztec antiquities; also several theaters and a circus: the bull-ring was demolished in 1874. In addition to the ordinary *alameda* or public walk of a Spanish city, Mexico is remarkable for the extent and beauty of its *paseos*, or raised paved roads, planted with double rows of trees, which diverge far into the country from every quarter of the city. Mexico still boasts a few of the water-gardens for which the ancient city was so celebrated, and, although no longer floating, as in the days of the Aztecs, they form attractive objects in the midst of the surrounding swamps, which, by the negligence of the Mexicans, have been suffered to increase in the vicinity of the lakes. The trade of Mexico is chiefly a transit-trade, although it has a few manufactures, as cigars of superior quality, gold-lace, hats, carriages, saddlery, etc.; and these articles, together with gold and silver, and some of the numerous valuable natural products of the Mexican plain, it transports, chiefly by means of mules, to Vera Cruz and other ports, importing in return the manufactured goods of Europe and various colonial products.

MEXICO, a village in n.e. Missouri, a junction of the St. Louis, Kansas City and Northern railroad, with the Louisiana and Missouri river railroad, and the South Branch; pop. '80, 3,841. It is the county seat of Audrain co., and is pleasantly located on an affluent of the Salt river. It is 50 m. n. of Jefferson City, and 108 m. w. of St. Louis. It is the seat of Hardin (female) college, has good public schools, an elegant court-house, a variety of stores, 3 newspapers, and 3 banks. Its industries are the manufacture of woolen goods and plows.

MEXICO, GULF OF, a basin of the Atlantic ocean, the estimated extent of which is 800,000 English sq.m., is closed in by the United States on the n., by Mexico on the w. and s., and its outlet on the e. is narrowed by the jutting peninsulas of Yucatan and Florida, which approach within 500 m. of each other. Right in the middle of this entrance is planted the island of Cuba, dividing the strait into two—the strait of Florida, 120 m. wide, between Cuba and Florida, and the strait of Yucatan, 105 m. wide, between Cuba and Yucatan. The former, or northern, entrance connects the gulf with the Atlantic ocean; the latter, or southern, with the Caribbean sea. The depth of water

is supposed nowhere to exceed three-fourths of a mile, yet the gulf contains few islands—the Florida Keys, the deltas of the Mississippi, and a few on the coast of Yucatan, being the most important of them. The shores, which are very sinuous, form numerous bays, the largest of which is the bay of Campeachy (q.v.). The coasts are mostly low and sandy or marshy, and are lined with numerous lagoons; good harbors are consequently not numerous, the best being those of Vera Cruz, New Orleans, Pensacola, and Havana. The gulf is visited by violent northern gales called *nortes*, which prevail from September to March, when they attain their maximum force and then immediately terminate. The most remarkable feature in connection with the gulf of Mexico is the *gulf stream* (q.v.), which enters it by the southern channel, passes round it and emerges through the strait of Florida. Owing partly to the presence of this heated current, the temperature of the gulf is 8° or 9° higher than that of the Atlantic in the same latitude

MEXICO, ANCIENT ARCHITECTURE OF, structural remains of the Aztec, Toltec, and other races who peopled Mexico prior to and at the time of the Spanish invasion under Cortez. Although these remains have been from time to time explored and investigated, it has been chiefly with the desire to sustain some comprehensive theory of comparative architecture, and from a stand-point of supposed similarity in their case to the remains of ancient Egypt, India, Greece, and, as lord Kingsborough conceived, of Jerusalem. Humboldt's work on New Spain first excited the curiosity of the Europeans, and rescued the antiquities of Mexico from the oblivion to which they had so long been consigned; but it was not until a comparatively recent period that their value as works of art, and as indications of a considerable advance in civilization, was fully appreciated. Pyramids having even a larger base, and being otherwise scarcely inferior in magnitude to those of Egypt, are found in many parts of Mexico; while the general condition of architecture at the period when these were erected has been found to be of a character to surprise and charm even those familiar with the monuments of the east. Mexican architecture is that of two distinct peoples: the Toltecs, who occupied Mexico prior to the 7th c. of our era, and the Aztecs, with whom may be associated the Chichemacas, who inhabited the country at the Spanish conquest early in the 16th century. That which is believed to belong to the earlier race is also the most remarkable; the later would seem to have been derived from it. Architecture in its essential features similar to that of the Toltecs exists in various parts of Central America, and may be associated with it. As far as our present knowledge extends, the architecture of Mexico is to be regarded as, in the main, self-developed, rather than borrowed from that of any other country. The buildings display vast labor, and often great skill, and are works of singular interest, promising to repay a far more thorough investigation than they have ever yet received. As in almost every other national architecture, the most important edifices are those devoted to the purposes of religion. These are known as teocallis, and appear, like the Egyptian temples, to have contained apartments for the priests; they also contained sepulchral chambers, and had descending galleries leading down into cavernous recesses or halls, which are variously conjectured to have been used for religious mysteries, or as places for the concealment of treasures, and may probably have been used for both purposes. In plan these buildings are square; in form pyramidal, generally rising in successive stories or stages, like a series of truncated pyramids placed one above another, each successive one being smaller than the one on which it immediately rests, so that it stands upon a platform or terrace; the holy place, or temple proper, being built on the summit, and subordinate in effect to the pyramid. The sides of the pyramids face the cardinal points; their angle of inclination is seldom less than 70°, which differs little from that of the pyramids of Egypt. The largest, most sacred, and best-known of these teocallis is that of Cholula, for which a fancied prototype has been found in the temple of Belus, as described by Herodotus. This pyramid-temple of Cholula is now in appearance little more than a vast mound of earth covered with vegetation, and crowned with a small church. But on near inspection its architectural features are sufficiently distinguishable. The base of this huge structure measures 1440 ft. each way (some authorities say 1488 ft.); its height is 177 ft; the sides of the base of the great pyramid of Gizeh are only 763 ft., so that the area of the Mexican pyramid is nearly four times that of the greatest of those of Egypt, but it is not a third of their height. The body of the pyramid of Cholula is formed of clay and sun-dried bricks. It consists of four terraces; and on the summit is a small church dedicated to the Virgin, which occupies a temple of the Toltec god of the air. From the perishable material of which it was constructed, the decorative features have almost entirely disappeared, though there are evidences remaining of what were once elaborate and interesting sculptures. In its present condition but a very imperfect notion can be formed of its original appearance. It contains spacious sepulchral cavities; and a square chamber formed of stone and supported by beams of cypress wood was some years ago discovered in it, within which were two skeletons and several painted vases. The buildings outside the limits of the valley of Mexico, and especially those in Central America, are in far better preservation. One of the most stupendous monuments of this style of architecture occurs at Palenque, in the state of Chiapas, Mexico. The great teocalli at Palenque (built, according to the startling assumption of lord Kingsborough, after the model of

the temple of Solomon) comprised within its extensive precincts various sanctuaries and sepulchers, courts and cloisters, subterraneous galleries, and cells for the habitation of the priests. The whole rests on a platform composed of three graduated terraces, and forms a spacious quadrangle inclosed by porticoes. On each side of the exterior is an ascent or flight of stairs, and on the east a second flight leading down, after the first is ascended, into the cloistered court. Beneath the cloisters are what are conjectured to have been initiatory galleries; and in the center of the quadrangle is what appears to be the ruins of an altar or "high place." The temple itself is oblong in plan, 76 ft. wide by 26 ft. deep, and is decorated with sculpture and hieroglyphics executed in stucco. The roof is formed by graduated courses of stone, which meet at the summit, and has six ornamental projections, placed above the openings formed by the supporting piers, which were probably intended to support small idols or ornamental figures. The city of Palenque itself exhibits a variety of buildings, temples, palaces, baths, and private houses, all manifesting excellence of workmanship combined with considerable skill in design. The palaces, or houses of the kings, appear to have resembled the temples in being based on pyramidal substructures; but these are generally oblong instead of square in plan, and much lower than the temple pyramids. Their substructure is usually of stone, and very massive, elaborately sculptured with figures of idols and masks of monstrous proportions, scrolls, mat-work, etc., often executed with great skill. The upper part appears to have been of wood, but has mostly perished. The ruins of Palenque extend for more than 20 m. along the summit of the ridge which separates the country of the wild Maya Indians from the state of Chiapas, and must anciently have embraced a city and its suburbs. The principal buildings are erected on the most prominent heights, and several of them, if not all, have been provided with stone stairs. The principal edifice, which has been sometimes styled a palace, is built in several squares; but the main halls or galleries run in a direction from the n.n.e. to the s.s.w.; and this position has been observed in all the edifices examined, be their situation what it may. The houses have all been substantially built of stone cemented with mortar; but symmetry has been but little studied in their construction, it is supposed less from ignorance than design. Other ruins of considerable magnitude, and distinguished by numerous sculptures, are found upon the neighboring hills. In the vicinity there is one building in particular, apparently a religious edifice, which deserves notice. Two galleries constitute its foundation; the front one occupying its whole length, while the back one is divided into three compartments. Of these the eastern has the appearance of a dungeon; the western is a small room with a chapel ornamented with elegant relievos. These consist of representations of the human figure, in various attitudes, and adorned generally with boughs and feathers. There are other very interesting ruins in this part of Mexico, but they have not as yet been sufficiently examined for description. One of the most characteristic of the palaces is that of Mitla, the remains of which show that it must have been an edifice of great extent and grandeur. It appears to have originally comprised five distinct portions, which have been regarded as places of retirement for the kings, or as tombs. Three of these still remain. The principal one is nearly 130 ft. long. A staircase leads to a subterranean apartment 88 ft. by 26, the walls of which, like the exterior, appear to have been sculptured or tooled in imitation of mat or basket-work—a species of decoration characteristic of Toltecan taste, and often found in sepulchral chambers. This same building has also a spacious hall supported by six plain cylindrical columns of porphyry, without base or capital, and in some respects differing from any found elsewhere. The ceiling which they support is formed of beams and slabs of cypress or savin wood of large size. Over the principal entrance is a stone lintel 12 ft. long and 3 ft. deep. There is no appearance of windows. The interiors of the chambers have been elaborately painted with representations of sacrifices, trophies, weapons, etc.; and with ornaments resembling those found in Etruscan decorations. At Testihuacan, about 25 m. to the n.e. of the city of Mexico, are several hundred small pyramids ranged in files or lines, and two larger ones, which are believed to have been consecrated to the sun and moon. Each of the latter is divided into four platforms, the slopes between which consisted of steps, and on the summit was a colossal stone statue covered with plates of gold, which were stripped off by the soldiers of Cortes, while the statues were destroyed. Besides monuments which are chiefly works of magnificence, others exist which attest the high degree of civilization attained by the Toltecans, such as roads and bridges. The former of these were constructed of huge blocks of stone, and frequently carried on a continued level, so as to be viaducts across valleys. There are also rock-hewn halls and caverns which curiously resemble the Pelasgic remains. Doorways to subterraneous galleries and apartments are found similar to the gate of Mycenæ; and another similarity exists in the peculiar triangular arch formed by courses of stone projecting over each other, of which specimens are found in the cloisters of the building at Palenque. There are also extensive works for defensive purposes, earthen sepulchral mounds, etc. The mountain of Tezcoca is nearly covered with ruins of ancient buildings. There is also evident a remarkable skill and high degree of taste in sculpture. Many of the statues found at Otumba, Mitla, Jochichalo, and the magnificent flower-temple of Oajaca, are sculptured in a purely classical style; while vases rivaling those of Egypt and Etruria have been discovered in sepulchral excavations. The successors of the Toltecs, the Chichemacas, the Acolhuas, and other nations of Mexico, built houses and formed

cities, seeming to be well skilled in architecture. The Mexicans (Aztecs) constructed their houses and public edifices with roofs of cedar, fir, cypress, or of a native wood called ojametl: the columns, of common stone, except in the palaces, were either cylindrical or square, and without base or capital. In the palaces these columns were of marble, and even alabaster. The pavements were of a common red stone, sometimes tesselated with marble and other ornamental substances. Cortes, in a letter to Charles V., said of Montezuma: "He had, besides those in the city of Mexico, other such admirable houses for his habitation, that I do not believe I shall ever be able to express their excellence and grandeur; therefore I shall only say that there are no equals to them in Spain." The Mexicans also constructed, for the convenience of their inhabited places, several excellent aqueducts. Those of the capital, for conducting the water from Chapultepec, 2 m. distant, "were two in number, made of stone and cement 5 ft. high, and 2 paces broad, upon a road raised for that purpose upon the lake, by which the water was brought to the entrance of the city, and from thence it branched out through smaller channels to supply several fountains, and particularly those of the royal palaces." The great temple in the city of Mexico, the sanctuary of *Mexitli*, whence "Mexico," was built by the emperor Ahuitzotl. It occupied the center of the city, and Cortes stated that on the space which it occupied a town of 500 houses could have been erected. It was inclosed by a square wall, 8 ft. high and very thick, crowned with battlements; built of stone and lime, and ornamented with many stone figures in the form of serpents. It had four gates to the four cardinal points, and over each gate was an arsenal filled with offensive and defensive weapons, from which the soldiers were supplied when it was necessary. In the center of the inclosure was an immense flat, solid building, built in five gradually narrowing platforms or terraces, with stairs to each terrace at the s.w. corner, so arranged that each terrace had to be traversed around the entire building before the next staircase could be reached. At the top of the structure, at one end, were two tall towers, sanctuaries; here also was an altar for sacrifice, and two stoves of stone, in which a fire was kept burning night and day. In the space between the wall and the great temple were 40 lesser temples; a place for the native religious dances; colleges for the priests and seminaries for children; and many other buildings, including a great house of entertainment for strangers of distinction who visited the place from curiosity, or to join in the religious rites performed there. Out of the city of Mexico the most celebrated temples were those of Tezcuco, Cholula, and Teotihuacan. Cortes said that from the top of one temple in Cholula he had counted more than 400 towers of others. Torquemada estimates that there were upwards of 40,000 throughout the empire, and there were certainly hundreds in each principal city. The peculiar coincidences of form, position, and ornamentation to be found between these structures and those employed for similar uses among the ancient Egyptians, have given rise to a belief in some relation between them, which is not unfounded; but no certain theory as to this relation has ever yet been formulated. For many years the ruins and monuments of ancient Mexico had been suffered to lie uninvestigated, and their secrets remain unrevealed—further than had occurred in the works to which reference has been already made, and others like them, of a comparatively remote date. In the spring of 1880 an expedition under the direction of M. Désiré Charnay undertook a careful exploration of the territory in question, and the result of this examination was communicated to the world by M. Charnay through the pages of the *North American Review*, from which we gather the following information. The first visit of the exploring party was made to the ruins of Teotihuacan, a city which is said by M. Charnay to have been about 23 m. in circumference. "At first view," he writes, "one can form no just idea of the grandeur of these ruins. As with ruins in general, especially when they are overturned and wrecked like those before us, one experiences a grievous disillusion when he looks at them for the first time. It is only after you have made a thorough study of them in mass and in detail that they impress you with their amazing vastness. Nowhere else in America can you, in my opinion, find a more imposing mass of ancient ruins, nor do I know of anything that can compare with this city of the gods." Here is the pyramid of the sun, whose base is 761 ft. square, and its height 216 ft.; its four sides facing the four cardinal points. It is constructed of volcanic *débris* laid in vegetable mold. There is no sign of mortar, but the structure was coated with cement, of which large slabs remain in perfect condition. Torquemada said of this city: "All these temples and palaces, and all these houses round about, were wholly built of white polished lime, so that on beholding them from afar one experienced no end of pleasure at the sight. The alleys, the streets, and the plazas were of colored and polished cement, and so fair were they, so cleanly and so shining, that it seemed impossible that human hands should have been able to construct them, or that human feet durst tread them. And so true is this that, all exaggeration aside, my report can be believed, for in addition to what others have certified to me I have myself seen certain ruins that gave proof of all I have said; and amid these temples were trees and flowers, magnificent gardens, and parterres breathing fragrance, all for the service and the ornamentation of the temples." It is stated that there were 27,000 buildings in Teotihuacan, not counting the temples. Charnay says that the term *Toltec* meant "builder," or "architect," and that it was applied to those who reared cities and built edifices, and not to any particular race or nation. In upper Mexico the material used in building was adobe; in some provinces a mixture of stones

and mud: at Hochicalco and at Teotihuacan a mixture of volcanic stones and mud, covered with a layer of cement; at Mexico it was adobe covered with cement or lime, and polished; at Oaxaca it was stones and mortar overlaid with cement, and this cement modeled into bas-reliefs; at Palenque, too, there are sculptured stones bearing inscriptions; in Yucatan there are pyramids and monuments of stone and mortar; the builders used the material nearest to them, but the general style of the architecture and the methods of building are in all instances nearly identical. Tula, which was another site visited by Charnay, the ancient metropolis of the Toltecs, 65 m. n. of the city of Mexico, was founded in 667. Here he excavated Toltec dwellings, found specimens of their sun-burned bricks, and numerous vases and other articles of pottery. He also claimed to have discovered fragments, or a fragment of a glass vessel, now iridescent from long burial under ground. A palace was also unearthed having 43 apartments. Under the reign of Mitl, in 927, the race and empire of the Toltecs reached the climax of their fortunes. The population had increased to such an extent that the nation occupied a territory more than 3,000 m. in circumference. The population of Teotihuacan is believed to have been half a million. M. Charnay's exploration is conducted with all the zeal and enthusiasm which characterized that of Dr. Schliemann in ancient Ilium, and promises to reveal much that has been unsuspected with regard to the ancient civilization of Mexico, as this was displayed in the condition of the arts, and particularly of architecture, among its people. In the mean time it has not advanced sufficiently far at the present writing to have demonstrated either the justness or the inaccuracy of past theorists on the probable origin to which these may be attributed. See CHOLULA and PALENQUE, *ante*.

MEXICO, PICTURE WRITING OF. See HIEROGLYPHICS, *ante*.

MEYENDORFF, the name of a Russian family which originally lived in Saxony. PETER, 1796–1863, was ambassador to Austria in 1850, and signed the convention of Olmütz. GEORG, d. 1863, wrote *Voyage d'Orembourg à Boukhara*. FELIX, d. 1871, was a son-in-law of prince Michael Gortchakoff, *chargé d'affaires* at Rome, and afterwards at Carlsruhe.

MEYER, FELIX, 1653–1713; b. Switzerland; studied art at Nuremberg, and afterwards under Ermels, a landscape painter. He then went to Italy to continue his studies, but the climate proving injurious to his health, he returned to Switzerland. He studied, and represented henceforth in his pictures, the scenery of his country. He was not successful as a figure painter; but as a landscape painter he united a quick imagination with great technical skill and swiftness of execution. In illustration of the latter quality, the story is told that he was one day asked by the abbot of St. Florian, in Upper Austria, the proper design for painting in fresco two great rooms in the abbey, which the artist engaged seemed unable to decorate in a suitable manner. Meyer at once sketched with a piece of charcoal the objects of natural scenery about the abbey which seemed to him worthy to be included in the frescos; and the abbot, impressed with his facility and fertile invention, employed him to carry out in fresco the charcoal sketches. Thenceforward his work received the patronage of the nobility. In the last years of his life he assumed a new manner in his pictures, and his productions in this later manner are by no means equal to his earlier work.

MEYER, HEINRICH AUGUST WILHELM, TH.D., 1800–73; b. Gotha. In 1831 he appeared as an exegetical commentator on the New Testament, displaying sound learning and acute criticism, combined with evangelical sentiments. His commentaries are highly esteemed. Besides his commentaries, he edited an important work on the evangelical confession, and preached for many years in the church at Hanover. An English translation of his commentaries is now publishing at Edinburgh, under the direction of Drs. W. P. Dickson, of the university of Glasgow, and F. Crombie, of St. Mary's college. Those on Galatians, Romans, and the Gospel of John have already appeared. Their value is very great.

MEYER, JEAN GEORGE (MEYER VON BREMEN), b. in Bremen, 1813; student 1833–42 in the art school of Düsseldorf, where he opened a studio. His first productions were religious works of large size, but the spirit of Meissonier soon possessed him, and he commenced that series of domestic subjects on diminutive canvas of which the exquisite finish and natural pathos have made his name a household word on two continents. In 1852 he established himself in Berlin, and so great has been the demand for his pictures that they have generally been sold into private hands before they could be placed in the great exhibitions. Their usual small size, and lively tone as well as delicacy of finish, make them peculiarly valuable as parlor pictures. Among his well-known paintings are "The Widow's Evening Prayer with Her Children," which has been engraved; "Inundated;" "The Return of the Soldier of the Landwehr," also engraved; "The Very Small Brother," engraved; "The First Prayer," engraved; "The Repentant Daughter;" "Grandfather's Visit;" "Fisherman's Children." The first named and "The Very Small Brother" were exhibited at the Paris exposition of 1855. A considerable number of his paintings are now in the United States.

MEYER, JOHANN HEINRICH, 1759–1832; b. Switzerland; studied painting at Zürich, under Füssly, brother of the well-known royal academician, Henry Fuseli.

In 1784 he went to Rome, where he met Goethe, with whom he contracted a friendship so intimate that he was known in Germany by the name of "Goethe-Meyer." After spending some time in Venice, Naples, and other Italian cities, he returned to Zürich in 1787. He made at Naples the acquaintance of Tischbein, and of Herder, who was making a tour of Italy as an *attaché* in the service of the duchess of Weimar. In 1792 he visited Goethe at Weimar, and was appointed to a professorship in the Weimar school of design. Three years later he revisited Italy, again passing much of his time at Naples and Florence. In 1797 he returned to Weimar, which became henceforth his home. He was on intimate terms with the court and the literary men and scholars at Weimar. He was honored with the title of *Hofrath*, and in 1807 was made a director of the academy there. He continued his intimacy with Goethe, who consulted him on all matters of art; and many of the critical portions of Goethe's works on art, such as *Kunst und Alterthum*, and *Winckelmann und sein Jahrhundert* are to be credited to Meyer. As a painter, his production was scanty. There is an allegorical frieze by him in the palace at Weimar, and he left a few water-colors, for the most part sketches from ancient works of art. It was as a writer on the history and theory of art, and particularly of Greek and Roman art, that he acquired authority. He published, with extensive annotations of his own, the works of Winckelmann. These notes he subsequently expanded into a general history of Greek art, which appeared at Dresden in 1820, under the name of *Geschichte der Bildenden Künste bei den Griechen*. A third volume of this work was published by Reimer, after Meyer's death, as *Geschichte der Bildenden Künste bei den Griechen und Römern*.

MEYERBEER, JAKOB, commonly called GIACOMO MEYERBEER, a celebrated musical composer of the present age, was the son of a wealthy Jewish banker, and was b. at Berlin, Sept. 5, 1794. He was a precocious child, playing tunes on the piano spontaneously (it is said) as early as his fifth year. He began to study dramatic composition under Bernhard Anselm Weber; and in 1810 entered the school of Vogler at Darmstadt, where he formed an intimate friendship with the renowned Karl Maria von Weber. While at Darmstadt, he wrote a cantata, *Gott und die Natur*. Subsequently, he composed an opera, *Jephthah*, produced at Munich in 1812; but though warmly admired by his friends, Vogler, Weber, and others, it fell flat on the audience, and was considered a failure. He now proceeded to Vienna, where he acquired a brilliant reputation as a pianist; but another opera which he produced here by command of the court, *Die beiden Khalifen*, was no more successful than the previous one. Italian music was the rage at the time, and nobody had a chance who did not imitate Rossini. Meyerbeer was induced by his friend Salieri to visit Italy, where he became an enthusiastic convert to the new Italian school, and began the composition of a series of operas which proved highly popular. We may mention his *Romilda e Constanza* (performed at Padua in 1819), *Semiramide* (Turin, 1819), *Emma di Resburgo* (Venice, 1820), the first of Meyerbeer's compositions that excited a furor; *Margherita d'Anjou* (1822), *Esule di Grenada* (1823), and *Crociato* (Venice, 1825). The last of these afforded, perhaps, the most decisive proofs of the high genius of its author, and was received with great applause in Paris, whither Meyerbeer now proceeded, and took up his residence. In 1831, was produced, after numerous rehearsals, his *Robert le Diable*, which caused an excitement "perhaps unparalleled in the history of the Parisian stage;" while it was received with nearly as great enthusiasm in England, Italy, Austria, and Russia; and in 1836, *Les Huguenots*, in which he reached the climax of his fame. His next opera, *Le Prophète* (1849), fairly sustained his reputation. It was followed by *Pierre le Grand* (1854), *Dinorah* (1858), and *L'Africaine* (1865). Meyerbeer died May 2, 1864.

MEYERS, a co. in s. central Dakota; drained by the s. fork of White river and by the Keyapaha which separates it on the s. from Nebraska; 1400 sq.m.; pop. '80, 115—29 of foreign birth. The soil is undulating and broken. As the country is very sparsely settled, there is little agriculture and no manufacturing.

MEYR, MELCHIOR, 1810—71; b. Germany; educated at Munich and Heidelberg. He made his first appearance as a poet, at the age of 25, and as a prose writer three years later. His most important works are *Stories from the Ries*, 1856–60; *God and his Kingdom*, 1860, with its sequel, *Emilia*, 1863; *Charles the Bold*, 1862; and *Talks with an Oaf* (*Grobrian*), 1866.

MEYRICK, FREDERICK, b. England, 1826; educated at Trinity college, Oxford, of which he was successively scholar, fellow and tutor; graduated in 1847, and has held the university offices of select preacher and public examiner. In 1856 he was appointed one of the queen's Whitehall preachers, in 1859 inspector of schools, and in 1869 became rector of Blickling with Erpingham in Norfolk. He was the chief agent in establishing the Anglo-Continental society for making known the principles of the English church in foreign countries, and published several controversial treatises in Latin, Spanish, Italian, etc. He is the author of *Practical Working of the Church in Spain; The Moral Theology of the Church of Rome; The Outcast and Poor of London; The Wisdom of Piety; But isn't Kingsley Right after All?; On Dr. Newman's Rejection of Liguori's Doctrine of Equivocation*. He has contributed also to Dr. Smith's *Dictionary of the Bible*, and to the *Speaker's Commentary* edited by Canon Cook.

MEYRICK, Sir SAMUEL RUSH, LL.D., 1783–1848, b. England; educated at Oxford. He married at the age of 20, against the wishes of his father, who disinherited him. In 1810 he published *The History and Antiquities of the County of Cardigan.* He was now called to the bar, and practiced law in the ecclesiastical and admiralty courts. In 1814, in association with capt. Charles Hamilton Smith, he published a book on the *Costume of the Original Inhabitants of the British Islands.* But his chief antiquarian work did not appear till 1824, under the title of *A Critical Enquiry into American Armor,* in 3 vols. 4to. He assisted rev. T. D. Fosbroke, in 1825, in the publication of *The Encyclopædia of Antiquities.* In the next year, he arranged the arms and armor in the Tower of London, and two years later, he performed the same service at Windsor castle, at the request of George IV. He was knighted by William IV., in 1832. He had already built near Goodrich castle on the Wye, a house called Goodrich court, arranged to exhibit his collection of armor, an account of which is to be found in Joseph Skelton's *Engraved Illustrations of Ancient Armor.* In 1836 sir Samuel furnished the text to Henry Shaw's *Specimens of Ancient Furniture.* His last important publication was *Lewis Dunne's Heraldic Visitation of Wales,* which appeared in 1846.

MEZEN, or MEZENE, a river in the n. of European Russia, rises in the n. of the government of Vologda, and flows n.w. into the White sea, having a course of about 450 miles.

MEZEN, or MEZENE, a district t. in the government of Archangel, European Russia, 50 m. from the mouth of the river of the same name, remarkable for the salmon and herring fisheries which supply St. Petersburg with frozen fish during winter. Pop. '67, 1746.

MEZERAY, FRANCOIS EUDES DE, 1610–83; b. in Séez, France; educated in the university of Caen; was for a time in the commissary department of the army. Its labors proving distasteful, he commenced writing in light literature, and perceiving that historical literature was not of a high order at that time, conceived the notion of supplying the want. His labors attracted the attention of Richelieu. The first vol. of his *History of France* appeared in 1643 in quarto, illustrated. Industrious, independent, and supercilious towards his predecessors, he produced a work that placed him temporarily at the height of fame. Richelieu sustained him. In 1651 he had published the 3d vol., and been made a member of the academy. His style is vigorous and original, and though far less thorough than modern historians, "his sagacity often supplies his lack of knowledge." After the *History of France* was completed, he made a translation of "*The History of the Turks*" by Chalcondyle. During the wars of the Fronde he mingled in the wordy war of pamphlets, poems, madrigals, and satires, with a profuse pen, distinguished more by its grossness than its wit; and largely aimed at cardinal Mazarin and his *belles nièces.* For the history of France in the 16th c., which was near to him, he is still the highest historical authority of his time.

MEZEREON, the bark of *daphne mezereum,* Lin.; *daphne gnidum,* Lin.; and *daphne laureola,* Lin. Natural order *thymelaceæ.* These three plants are small shrubs from 2 to 4 ft. high. *Daphne mezereum* has rose-red, sessile, fragrant flowers, in small clusters, preceding the deciduous leaves. It is indigenous to hilly and mountainous regions of Europe, extending to the Arctic circle and eastward to Siberia. The other two species grow in southern Europe, *D. laureola,* spurge laurel, has large evergreen leaves and yellowish-green flowers in axillary clusters. *D. gnidum,* spurge flax, has narrow, annual leaves, and small white flowers in terminal racemes. Mezereon bark occurs in commerce in long bands about one-half an in. wide and one-twentieth an in. thick, folded and tied together in bundles, or rolled up into flat disks. The dried bark is inodorous, but has a persistently acrid and burning taste. The bark of *D. gnidum* is darker, and that of *D. laureola* is more gray and has a greenish bast. They resemble mezereon in acridity. The root bark of the three species is the strongest, but the stem bark is the more common. It is used as an adjunct to sarsaparilla in making the compound decoction and the compound extract of that drug. Ancient and modern authorities assign to mezereon irritant qualities, and it was long ago used as an emetic, purgative, cholagogue, emmenagogue, and sudorific. It has produced narcotism and convulsions, acrid and blood-red urine, and death has sometimes followed its experimental use on animals. In medicinal doses the decoction causes salivation and increased cutaneous and mucous secretions, described as having a peculiar odor. A case is recorded of a girl upon whose cheek the fresh juice had been rubbed. This was followed by a vesicular eruption, fever, internal disorders, and after a period of nine months, death. Notwithstanding this, it is still used as a local irritant in the form of the juice, and that of an ointment. It once had a reputation for curing skin diseases.

MEZIERES, a fortified t. of France, capital of the department of Ardennes, on a bend of the Meuse, which washes its walls on two sides, and separates it from Charleville (q.v). It was strongly fortified by Vauban, and is defended by a citadel. It communicates with Charleville by a suspension-bridge. In 1815 the town held out for two months against the allies, who besieged it after the battle of Waterloo. Over the n. aisle of the church is a bomb-shell, which has been sticking there ever since the town capitulated. In 1520 the chevalier Bayard, with 2,000 men, successfully defended it against 40,000 Spaniards under Charles V. In the Franco-German war of 1871 Mezieres capitulated after a cannonade of two days. Pop. '76, 5,204.

MÉZIERÈS, ALFRED, b. at Rehon on the Moselle in 1826; educated in Paris; professor of foreign literature at Nancy in 1854, and afterwards assistant professor of the same in Paris. Among his published works are *Memoire sur le Pelion et l'Ossa*, 1853; *Shakespeare, ses Œuvres et ses Critiques*, 1861; *Prédécesseurs et Contemporains de Shakespeare*, 1863. The last two works were crowned by the French academy. *Contemporains et Successors de Shakespeare*, 1864; *Dante et l'Italie Nouvelle*, 1865; *Charades et les Homonymes ou l'Art de s'Instruire en s'Amusant*, 1866; *Petrarch*, 1867; and *Recits de l'Invasion, Alsace et Lorraine*, 1871.

MEZÖ-TUR, a t. of Hungary, on the Berettyo, an affluent of the Köros, 60 m. s w. of Debreczen. Pottery is made, and there is an important market. Pop. '67, 20,447.

MEZQUITE, the name of two Mexican trees or shrubs, of the natural order *leguminosæ*, suborder *papilionaceæ*, bearing pods filled with a nutritious pulp. The COMMON MEZQUITE (*algarobia glandulosa*) is a small shrub, with stems often decumbent, and armed with strong straight spines. It is found in great profusion throughout vast regions, chiefly consisting of dry and elevated plains. In dry seasons it exudes a great quantity of gum (*gum mezquite*), similar in quality to gum-arabic, which seems likely to become a considerable article of commerce, and which has begun to be exported to San Francisco from the Mexican ports on the Pacific.—The CURLY MEZQUITE or SCREW MEZQUITE (*strombocarpa pubescens*), also called SCREW BEAN and TOURNIL, although only a shrub or small tree, is of great value in the wild and desert regions of the western part of North America, where it occurs along with willow bushes near springs of water. Its wood is used as fuel, and the pulp of its pods for food. The pods are spirally twisted into compact rigid cylinders, from an inch to an inch and a half in length.

MEZZO signifies middle, or mean, and is generally used in music in conjunction with some other word, as mezzo-forte—moderately loud; mezzo-piano—rather soft; mezza-voce—with a moderate strength of tone; mezza-orchestra, with half the orchestra, etc. When written alone and applied to the grand piano-forte it denotes that the pedal is to be used, avoiding one of the sets of strings

MEZZOFANTI, GIUSEPPE, Cardinal, a remarkable linguist, was b. Sept. 17, 1774, at Bologna, where he received his education, and subsequently (1815) received the office of university librarian. In 1831 he settled in Rome, and was advanced to the dignity of monsignore; in 1833 he was appointed secretary of the college of the propaganda; then keeper of the Vatican library, and in 1838 he was raised to the dignity of cardinal. He died Mar. 15, 1849, at Rome. Mezzofanti's European reputation was founded not on any literary or learned works that he wrote, but on the almost miraculous extent of his linguistic acquisitions. Towards the end of his life he understood and spoke fifty-eight different tongues. As early, indeed, as 1820 lord Byron called him "a walking polyglot, a monster of languages, and a Briareus of parts of speech." He was not in the strict sense a critical or scientific scholar; yet, although his linguistic skill lay chiefly in verbal knowledge, his acquirements in other departments were by no means inconsiderable. See Russell's *Life of Cardinal Mezzofanti* (Lond. 1858).

MEZZOJU'SO (Arab. *Menzil-Jussuf*, village of Joseph), a t. of Sicily, in the province of Palermo, 18 m. s.s.e. of Palermo city. It is one of the four colonies of Albanians who, on the death of Scanderbeg, in the 15th c., fled to Sicily to avoid the oppression of the Turks. They preserve their language to a great extent, and follow the Greek ritual, their priests being allowed to marry; but, except on fête-days, they are not to be distinguished in feature or dress from the peasantry of the rest of Sicily. Pop. 5,700.

MEZZOTINTO, a style of engraving on copper and steel which was very popular during the first half of the 19th c. in England and America, being applied to reproduction of works of the masters; and also to the illustration of subjects for the class of gift-books known as "annuals," and which were greatly in vogue between 1820 and 1860. In this style of engraving, which essentially differs from every other, the surface of the plate is first indented or hacked all over by the action of an instrument something like a chisel, with a toothed or serrated edge, called a cradle, or mezzotinto grounder. This tool, being rocked to and fro in many directions, indents or barbs the plate uniformly over its face, and produces what is called the mezzotinto grain or ground. The barb or nap thus produced retains the printing-ink; and if in this state of preparation an impression were taken from the plate upon paper, it would be uniformly of a deep black color. The directions, or *ways*, as they are technically called, given to the grounding-tool are determined by a regulated plan, and for this purpose an ingenious sort of scale is used which enables the workman to pass over the plate in almost any number of directions without repeating any one of them. The mezzotinto ground being thus laid, it is at this period that the business of the artist properly commences. Having traced or drawn, with a pencil or other instrument, his outline upon the paper (unless, as is sometimes the case, this should have been etched by the ordinary process previous to the mezzotint ground having been laid), he proceeds to remove the nap or ground, in conformity with the design, from all those parts which are not intended to be perfectly black in the impression. The instruments required for this purpose are scrapers and burnishers; with the former he scrapes away more and more of the ground in proportion to the brightness of the light, and the burnishers are used to produce perfect whiteness

where it is required, as the high lights on the forehead or tip of the nose, or white linen in a portrait, etc. As the work proceeds it may be blackened with ink, applied with a printer's ball or otherwise, to ascertain the effect; after which the scraping may again be proceeded with, the artist taking care always to commence where the strongest lights are intended to appear. The great facility with which mezzotinto engraving can be executed, as compared with line-engraving, was the principal cause of its popularity in the days of the height of its success. But it also possesses peculiar advantages of richness of color, capacity for broad contrast of light and shade, and mellowness of tone, which adapt it for certain classes of work, and, in its proper place, enable it to produce effects not otherwise attainable. The richness and depth of the shadows in this kind of engraving are measurably balanced, however, in the corresponding poverty of the lights. Where these occur in masses in mezzotinto-engraving the effect is cold and unsatisfactory. At first copper was used in the production of mezzotinto-engraving, but steel plates eventually superseded them, on account of the greater scope which its hardness afforded to the tools employed, and also the very much larger capacity for impressions of steel plates. The legend which associates the name of prince Rupert with the discovery of the art of mezzotinto-engraving is an interesting one; and, as the Italians say, *si non e vero, e ben trovato.* It is said that the prince observed one morning a soldier engaged in cleaning his musket, removing from it the rust which the night-dew had occasioned; and perceiving upon it, as he thought, some resemblance to a figure, it occurred to him whether or not, by corroding or grounding plate all over in a manner resembling the rust, he might not afterwards scrape away a design upon it, from which impressions might be obtained. It is alleged that he succeeded, and thereby accomplished the invention. Unfortunately for the claim set forth in behalf of prince Rupert, it has been proven groundless, and the prince is accused of having learned the art from its original inventor or discoverer. This was Louis von Siegen, a lieut.col. in the service of the landgrave of Hesse-Cassel, and his first work which was published was a portrait of the princess Amelia-Elizabeth of Hesse, proofs of which before letter bear the date 1642, or fifteen years anterior to the earliest of prince Rupert's dates. This method of illustration was not only adopted by sir Joshua Reynolds, but even employed in so important a work as Turner's *Liber Studiorum.* In the United States the mezzotinto style was a favorite with magazine publishers in the early days of that kind of literature, being introduced from England by John Sartain, an expert mezzotint engraver, in 1830. He published *Sartain's Magazine,* illustrated after this fashion. See ENGRAVING.

MGLIN, a t. of Russia, in the government of Tchernigov, 125 m. n.n.e. of the town of Tchernigov. There is a large cloth-factory, and a considerable number of German families. Pop. '67, 5,842.

MHENDIGUNJ, a t. of British India, in the territory of Oude, 90 m. s.e. of Lucknow, 3 m. s. of the right bank of the river Saee. It is a busy, thriving place, with a population estimated at 20,000.

MHOW, a t. of British India, in the territory of Indore, 13 m. s.w. of the town of Indore, near the Vindhyan mountains, on an eminence on the Gumber river. Near it are the cantonments, which have altogether the appearance of a European town, having a church with steeple on an eminence, a spacious lecture-room, a well-furnished library, and a theater. They are situated at an elevation of 2,019 ft. above the sea, and are occupied by a considerable force. On the 1st of July, 1857, the sepoys mutinied here during the great rebellion of that year.

MIA'CO. See MIAKO.

MIAGAO, a t. in the island of Panay, one of the Philippine isles, in the province of Iloilo. The inhabitants, who are industrious, comfortable, and well educated, are estimated at 31,000 in number.

MIA'KO, or KIOTO, now called SAI-KIYO; the ancient capital of Japan, situated in the s.w. of the island of Nipon. Broad and clean streets cross each other at right angles, and the houses are mostly of the better class. During the double rule in Japan it was the residence of the mikado, then only the spiritual emperor, and was and is the stronghold of the national religion. Some of the temples are of great size and splendor. In 1868 the great revolution broke out; the shogun, or temporal ruler, was deposed; and the mikado, who was now invested with complete authority, both temporal and spiritual, removed his court to Yedo. Most of the aristocratic dwellings are consequently tenantless, and the population in 1876 was only 374,496. Miako is still, however, the seat of considerable trade with the interior. It is also a center of Japanese literature and art, and is well provided with public schools for boys and girls. It is famed for the manufacture and dyeing of silks. Miako is connected by railway with Osaca and Hiogo.

MIALL, EDWARD, b. England, 1829; educated at the Protestant dissenters' college in Wymondley, Herfortshire, where he studied for the ministry. He was for three years a minister of the Independent church at Ware, and was afterwards settled in the same capacity at Leicester. In 1841 he left Leicester for London, where he established the *Nonconformist,* which he still owns and edits, and which remains the chief organ of the English dissenters. He contested, unsuccessfully, a seat in parliament in 1845 and 1847;

but was returned from Rochdale in 1852. He was defeated in 1857, but sat for Bradford from 1869 to 1874. He is a leader of the movement for the disestablishment of the English church, and a supporter of universal suffrage. The adherents of the views which he represents gave him, in 1873, a purse of £10,000 in recognition of his services as editor and member of parliament in behalf of complete civil and religious equality. He has written a number of works in support of his ideas—*Views of the Voluntary Principle*, published in 1845; *Ethics of Nonconformity*, 1848; *The British Churches in Relation to the British People*, 1849; *Title-Deeds of the Church of England to her Parochial Endowments*, 1861. Of a less polemical character is his *An Editor off the Line; or Wayside Musings and Reminiscences*, 1865.

MIA'MI, a river of Ohio, United States of America, rises by several branches in the western center of the state, and after a s.s.w. course of 150 m. through one of the richest regions of America, and the important towns of Dayton and Hamilton, empties itself into the Ohio river 20 m. w. of Cincinnati. It is sometimes called the Great Miami, to distinguish it from the Little Miami, a smaller river, which runs parallel to it, 15 to 25 m. e., through the Miami valley.

MIAMI, a co. in n. Indiana, crossed centrally by the Wabash and Erie canal, the Evansville and Terre Haute railroad, the Eel River railroad, and the Indianapolis, Peru and Chicago, and Pittsburg, Cincinnati and St. Louis railroads; 380 sq.m.; pop. '80, 24,083—22,843 of American birth, 240 colored. It is drained by the Wabash, Eel, and Mississinewa rivers, and Pipe creek. Its surface is generally level, the banks of the rivers rising much higher than the interior plains; a large proportion being covered with hard wood forests, oak openings, and groves of sugar-maple trees. Its soil is fertile, especially the bottom lands, producing tobacco, wool, Irish and sweet potatoes, wine, dairy products, hops, flax, maple sugar, sorghum, honey, and grain. Stock raising is extensively carried on, and there is much valuable water power. Its manufactories include a brewery, woolen factories, cabinet-making establishments, and manufactories of carriages, lumber, furniture, cigars, agricultural implements, etc. Seat of justice, Peru.

MIAMI, a co. in e. Kansas, having the state line of Mississippi for its e. boundary; intersected centrally by the Kansas City, Fort Scott and Gulf railroad, and the Osage branch of the Missouri, Kansas and Texas, forming a junction at Paola; 600 sq.m.; pop. '80, 17,818—16,677 of American birth, 902 colored. Its surface is undulating and spreads out into broad prairies with a small proportion of woodland. It is drained by the Osage river, or Marais des Cygnes, and Peoria, Wea, and Pottawatomie creeks. Live stock is raised, and the fertile soil produces Indian corn, oats, wheat, potatoes, wool, and the products of the dairy. Limestone is the foundation of the soil, and it contains beds of bituminous coal; petroleum is also found. Among its manufactories are carriage shops, and it has saw-mills, and wind-mills for grain. Seat of justice, Paola.

MIAMI, a co. in s.w. Ohio, intersected by the Great Miami river, and drained by Greenville and Stillwater creeks; 400 sq.m.; pop. '80, 36,178—34,039 of American birth, 1,176 colored. It is traversed by the Dayton and Michigan railroad, and the Columbus, Chicago and Indiana Central railroad, crossing it centrally, and forming a junction at Piqua, and the Miami and Erie canal, following the general course of the Dayton and Michigan railroad, and the Great Miami river. Its surface is undulating and well wooded, particularly in the e. portion. It has limestone quarries in the w., and the soil having generally an under-stratum of Silurian limestone, is very fertile, and produces large quantities of fruit, grain, tobacco, wool, Irish and sweet potatoes, dairy products, flax, maple sugar, sorghum, and honey. Live stock is an important commodity. The extensive hydraulic power of the river is utilized, and its trade in grain is considerable. Among its manufactories are tanneries, distilleries, breweries, spring-wagon and wheel works, machine shops, and oil mills; other manufactures are carriages, furniture, wool, clothing, brick, and metallic wares. Seat of justice, Troy.

MIAMIS, a tribe of Indians of the great Algonquin family, and whose habitat was in the neighborhood of Green bay (Wisconsin) as early as 1658, when they were found there by the French. They were also discovered in 1670 about the Fox river, to the number of 8,000, and disclosing social and tribal conditions of a more elevated character than those usual among the tribes so far north. They occupied a village of houses made of matting, and surrounded by a palisade; and their chief displayed several of the adjuncts of rank and authority. Later, this tribe was collected on the St. Joseph's river, and in 1683 they were at war with the Sioux and the Iroquois at the same time, being aided by the Illinois, who were friendly to them, in their struggle with the latter. They afterwards became inimical to the French, and made overtures to the English, being by this time engaged in a war with the Hurons, and threatening the Chippewas. The Miamis were in fact a warlike tribe, and not a little aggressive. In 1705 the French brought about a war between them and the Ottawas. Finally, when the French and English war broke out, they were in doubt to which side to ally themselves, but generally supported the English and made depredations on the French. Yet when the French were driven out of that part of the country the Miamis united with Pontiac in the capture of the British forts, St. Joseph's and Miami: and when the American revolution began they opposed

the patriots and sided with the English. After the close of the revolutionary war they continued to oppose the settlement of the country by the whites, and in 1790 it was found necessary to send a force against them under gen. Harmer. A series of battles, in which success veered from one side to the other, failed to effect a reconciliation, and hostility continued until 1795, when peace was made. In 1790 they had been able to put in the field only about 1500 warriors, and after the peace they rapidly dwindled in numbers and importance. They now ceded lands between the Wabash river and the Ohio state line, but the new mode of living imposed upon them by the nature of the annuity system completed their degradation. Their naturally warlike and energetic character succumbed to the inroads effected by an idle life and facility for obtaining intoxicating liquors; and though they broke into action and attacked the whites on one or two occasions, their ancient spirit had deserted them, and these conflicts availed them nothing. In 1822 their entire number amounted only to between two and three thousand, living on three different reservations. They gradually ceded all their lands to the U. S. government, and in 1846 they were removed to the neighborhood of the fort Leavenworth agency. They then numbered only 350 souls, and were dissipated and wretched in the extreme. About the year 1873 the remains of this once powerful tribe, 150 in number, were finally placed on the Quapaw reservation.

MIANTONOMOH, the name of a sachem of the Narragansett tribe of Indians, who succeeded his uncle, Canonicus, in 1636. He was on friendly terms with the early settlers of Massachusetts, and assisted them during the Pequot war. In 1642 he conducted an expedition against Uncas, the Mohegan chief, but was unsuccessful, and was captured at Norwich, Conn. Uncas surrendered him into the hands of the commissioners of the united colonies, and his execution being advised by them, he was tomahawked on the spot where he was captured, known as Sachem's plain, and where a monument in commemoration of the event was set up in 1841.

MIAS'MA (Gr. pollution; in the plural, *Miasmata*), or MALARIA. It is proved by the experience of all ages that there is an intimate connection between marshy districts and certain diseases, especially the various forms of intermittent and remittent fever; but the exact nature of the noxious agent, and the circumstances on which its formation and extrication depend, are even at the present day not altogether established. It is clearly neither heat nor moisture, for the crews of clean ships, when cruising in the tropics at a distance from land, are usually very healthy; nor is it any known gas extricated from the marsh, for the gases collected by stirring up marshes (carbonic acid, nitrogen, oxygen, and carbureted hydrogen) may be inspired without giving rise to any symptoms resembling those produced by malaria. It may be regarded as an established fact that the noxious agent is a product of vegetable decomposition occurring under certain conditions of heat and moisture. That vegetable decomposition is the source of the poison is inferred from various circumstances. For example, this special morbific influence is nowhere so powerful as in the deltas and along the banks of large tropical rivers which, in their flood, bring down the washings of the soil, full of vegetable remains, which, upon the subsidence of the waters, are left reeking in the hot sun. Again, the poison has been traced, in various places in Italy, France, and the Netherlands, to the practice of steeping flax in stagnant waters, and even in streams, and in India it was formerly the custom, after extracting the coloring matter, to throw the remains of the indigo into large heaps which, in the course of three years, became excellent manure; it was found, however, that these heaps, alternately soaked by the heavy rains and heated by a tropical sun, decomposed and emitted miasmata precisely similar in their effects to those produced by marshes. Marsh-miasmata are seldom evolved at a temperature under 60°, but at and above 80° they are prevalent and severe; and the nearer we approach the equator, the more violent, as a general rule, do they become. Although moisture is necessary to the evolution of miasmata, an excess of it often acts as a preventive, and by impeding the access of atmospheric air retards or prevents decomposition. This explains the apparent anomaly of an uncommonly rainy season producing opposite effects in different localities, sometimes not far distant from one another. Thus in the West Indies a very rainy season induces general sickness in the dry and well-cleared island of Barbadoes; while at Trinidad, whose central portions are "a sea of swamp," and where it rains nine months in the year, the excessive rain is a preservative from sickness; for in the seasons when the rain falls only eight months or less, the swamps become dry and exposed to the sun, and severe remittent fevers are sure to follow.

Chemistry has hitherto failed in detecting any special ingredient to which the air evolved by marshes owes its poisonous qualities. The air collected in the most poisonous districts gives, on analysis, the same gases existing in the same proportions as normal air, nor (if we except the observations of Boussingault, which have not been confirmed by other chemists) does it give evidence of the presence of any organic body.

The infecting distance of this poison is a subject of great practical importance; and both the altitudinal range and the horizontal spread have to be noticed. In Italy it is estimated that an altitude of about 1,500 ft. assures an exemption from marsh-poison; while in the West Indies an elevation of at least 2,000 ft. is necessary. From observations made by sir Gilbert Blane during the ill-fated Walcheren expedition, it appears that in Europe the horizontal spread of marsh-miasmata over fresh water is less than

3,000 ft.; but over salt water—at all events, in the tropics—the horizontal range is greater. The extent to which the poison may spread horizontally over land is a much more complicated question, and depends, to a great extent, upon the nature of the soil. The effect of trees in intercepting miasmata is very remarkable, and is probably due partly to their condensing the vapors of the marsh, and partly to their altering the direction of the current of air. Pope Benedict XIV. caused a wood to be cut down which separated Villatri from the Pontine marshes, and in consequence, for many years, there was a most severe and fatal fever in a district previously healthy; and the same results have in many other cases followed the removal of trees.

In districts where this poison exists it is found by experience that those who go out of their houses only during the day, after the morning fogs have dispersed, and before the evening mists appear, often escape the bad effects; and a full meal, with a few grains of quinine, should be taken before exposure to the morning air by travelers in a malarious district.

Dr. Wood of Philadelphia has pointed out the extraordinary and very important fact, that miasmata are neutralized, decomposed, or in some other way rendered innocuous by the air of large cities. Though malarious diseases may rage around a city, and even invade the outskirts, yet they are unable to penetrate into the interior, and individuals who never leave the thickly-built parts almost always escape. What it is in the air of the city which is thus incompatible with malaria, is unknown; but very probably it is connected with the results of combustion, for the fire and smoke of camps are asserted to have had the same effects. See MALARIA.

MIAULIS, ANDREAS VOKOS, 1770—1835, b. Greece; adhered to the Greek revolutionists in 1821, and the next year, was put in command of the Greek fleet. In March of that year, he defeated a Turkish squadron at Patras, and in September, another squadron near Spezzia. In 1825 he burned the fleet commanded by Ibrahim Pasha near Modon. He left the service in 1827, upon the appointment of lord Cochrane, as his superior in command. He was soon restored to his old rank, and stationed at the harbor of Poros. He participated in the insurrection of 1831, and burned the fleet under his command at Poros, to keep it out of the hands of the Russians. He was indicted for treason, but the proceedings came to nothing. In 1832 the naval stations in the Archipelago were placed in his charge. Soon after, he was made vice-admiral.

MIAUTSÉ, the aborigines or hill-tribes of China. From the dawn of Chinese history, we find the people of the plains contending against those of the high lands, and to the present day the hardy mountaineers have maintained their independence. They consist of numerous tribes, occupying large portions of Kwang-se, Kwei-chow, Yun-nan, Sze-chuen, and adjacent provinces. Some of them own Chinese sway; other tribes are absolutely independent. They are smaller in size and stature, and have shorter necks, and their features are somewhat more angular than the Chinese. Their dialects are various, and wholly different from the Chinese. Dr. Macgowan describes them as skillful in the manufacture of swords. He has shown that the Miautse of Western China and the Karens or hill-tribes of Burmah are identical.—Reports of Dr. Macgowan's Lectures.

MIA'VA, a market-town of North-west Hungary, on the Miava, an affluent of the Morava, 48 m. e.n.e. of Presburg city. There are manufactures of woolen cloth and bagging, and hemp and flax are cultivated. Pop. '69, 9,637.

MI'CA, (from the same root with Lat. *mico*, to glitter), a mineral consisting essentially of a silicate of alumina, with which are combined small proportions of silicates of potash, soda, lithia, oxide of iron, oxide of manganese, etc., according to which and the somewhat varying external characters, numerous species have been constituted by mineralogists. COMMON MICA, also called POTASH MICA, contains a notable but variable proportion of silicate of potash; it contains also a little fluorine. It is a widely diffused and plentiful mineral, entering largely into the composition of granite, mica-slate, and some other rocks, veins and fissures of which it also often fills up. It has a strong, and often almost metallic luster. It is remarkable for the readiness with which it splits into thin elastic plates, which are generally transparent. The thinness and elasticity of these plates readily distinguish them from those of talc, and of the laminated variety of gypsum; they are also devoid of the greasy feel of talc. They are sometimes not more than one 300,000th part of an inch in thickness, are generally quite transparent, and are therefore much used in setting objects for the microscope. Plates of Mica of large size are also used in Siberia, Peru, and Mexico as a substitute for glass in windows. Large plates, often a yard in diameter, are found in these countries, and in Norway and Sweden. Mica is advantageously substituted for glass in lanterns, as it bears sudden changes of temperature better than glass, and in ships-of-war, as it is not liable to be broken on the discharge of cannon. Another use of Mica is for making an artificial avanturine; it is also employed in a powdered state to give a brilliant appearance to walls, and as a sand to sprinkle on writing. In the state of a very fine powder, it is known as *Cat's Gold*, or *Cat's Silver*, according to its color. It is usually colorless, but sometimes white, gray, green, red, brown, black, and rarely yellow, owing to the presence of iron, manganese, chrome, fluorine, etc., in its composition. It is sometimes found in beautiful crystals, which are generally rhombic or six-sided tables. LITHIA MICA, or LEPIDOLITE, contains lithia in small proportion. It is often of a rose color, or a peach-blossom color. It is

used for ornamental purposes. It is found in several places in Britain.—MAGNESIA MICA, or BIOTITE, contains about as much magnesia as alumina. It is often dark green.

MI'CAH, the sixth (third in the lxx.) of the twelve minor prophets (Micayahu: Who is like unto Jah ?), probably a native of Moresheth, prophesied during the reigns of Jotham, Ahaz, and Hezekiah, and was therefore contemporary with Isaiah, and Hosea, and Amos.—The BOOK OF MICAH is regarded as divisible into three parts, each commencing with "Hear ye," organically connected, however, with each other, and showing even a progressive development of idea in the mind of the writer. The destruction of Samaria (Israel), the danger and subsequent captivity of Judah; the wickedness of the rulers, the punishments that overtake the land, the glorious restoration of the theocracy; Jehovah's "controversy with his people" on account of their sins, his warnings, his exhortations, and his sublime promise of forgiveness, form the principal points of Micah's prophecies, which relate to the invasions by Shalmaneser, Sennacherib, the Babylonian exile, the return, and the re-establishment of the theocracy under Zerubbabel. The style of Micah is clear, vivid, concise, yet richly poetical; some passages, especially in the beginning and the last two chapters, are among the noblest in the Old Testament. The play upon words noticeable in Isaiah is also a marked feature of this writer.

MICAH, PROPHECY OF (MICAH, *ante*), after the heading contained in the first verse, is divided into three sections, each beginning with "Hear ye," I.—Chapters i. ii, addressed to all the people, describe the coming of the Lord in judgment on the transgressions of Israel and Judah, the doom of Samaria; and the march of the invaders of the land from Samaria south to Jerusalem; denounce luxury and covetousness as the sources of transgression, and condemn the false prophets for leading the people astray; foretell the banishment of the people into captivity and promise their return under the guidance of the Lord their king. II.—iii.-v., addressed to the heads and princes of the people, condemn their oppressive rapacity, and declare that as they had been deaf to the cry of the poor in their wrongs, they too shall call on the Lord but will not be heard. The false prophets also who had deceived others should themselves be made ashamed. As the judges, priests, and people had become mercenary in all their service all of them should be left destitute, Zion should be a ploughed field, Jerusalem heaps of ruins, and the temple height a forest. This second threatening of judgment is followed by a second and fuller promise of Messianic times when the mountain of the Lord's house should be exalted on the top of the mountains, all nations flow to it, and the peaceful reign of the Messiah be extended over all the earth. His birth in Bethlehem Ephratah is foretold, yet his being from everlasting also is affirmed; his government, it is declared shall be marked by divine strength and majesty, and his greatness be extended over all the earth. III.—vi., vii. The Lord, calling on the people the third time to hear, and on the mountains to be witnesses of the controversy, appeals to all his past government over Israel as approving his righteousness. The people, answering, complain that the burden of the sacrifices required is too great to be borne, and the Lord in reply says that he asks of them only to do justly, love mercy, and walk humbly with God. That they had failed to comply with these demands is shown by the treasures of wickedness found in their houses, by the scant measures used, the false balances, the deceitful weights. For these crimes punishments will be inflicted; the wheat, the oil, and wine shall be cut off. The prophet mourns the justice of the sentence, and acknowledges the guilt of all classes of the people who do evil with both hands earnestly, the best of them being sharp as briers and thorns. Yet he waits for the salvation of the Lord, triumphing in his pardoning mercy which will certainly be manifested and in his faithfulness which will perform all that he had promised with an oath to Abraham in the days of old.

MICA'LI, GIUSEPPE, 1776–1844, b. Italy; after prolonged travels, devoted himself to the study of archæology. His most important work is his *Italia avanti il Dominio de'Romani.* It was published under that title in 1810, and a revised edition, with extensive changes, appeared in 1832, as *Storia degli Antichi Popoli Italiani.* Raoul Rochette made a French translation of this work. Micali's last book was the *Monumenti Antichi,* which was issued the year of his death.

MICA-SCHIST is, next to gneiss, one of the most abundant of the metamorphic rocks (q.v.). It consists of alternate layers of mica and quartz, but is sometimes composed almost entirely of the thin and shining plates or scales of mica, and from this it passes by insensible gradations into clay-slate. The quartz occurs pure in thin layers like vein quartz. Garnets are in some districts abundant in this rock, making up a large proportion of the whole mass. Mica-schist is believed to be a highly altered shale or clay deposit, and the component minerals, including the garnets, to have been developed under the influence of metamorphic action from materials already existing in the unaltered strata. In many places the mica-schist has a finely corrugated or wavy structure.

MICASLATE, a variety of mica-schist (q. v) containing more clayey matter than that which generally passes under the name of schist, and also having the micaceous scales more finely divided, so that they are scarcely visible by the unaided eye. Practical geologists use the term to designate a condition midway between mica-schist and clay slate. *Hydromica schist,* or *slate,* is a thin schistose rock consisting principally of

hydrous mica, with occasionally more or less quartz, and having a greasy feel, like talc (q.v.); whitish to pale green, and darker, in color, pearly to glistening luster. It used to be called talcose slate, but contains no talc, as shown by Dr. C. Dewey. There are several varieties.

MICHAEL, THE ARCHANGEL, meaning in Hebrew, "*Who is like God,*" in Scripture a prince among the angels, whom the Divine Being, that appeared to Daniel in human form, described as a guardian of the Jewish people co-operating with him in their behalf, thwarting the efforts of their human adversaries and resisting also the schemes of Satan against them. This is in accordance with other Scripture teachings concerning the angel Jehovah as directing the history of Israel and concerning the angels as subject to him in the work of redeeming men. In the epistle of Jude Michael is called the archangel, and it is said concerning him that "when, contending with the devil, he disputed about the body of Moses, he durst not bring against Satan a railing accusation, but said, The Lord rebuke thee." Some interpret this passage as affirming a dispute about the literal body of Moses which the Lord buried in a sepulcher unknown to men. Others regard the "body of Moses" as a symbolical phrase for the Mosaic law and institutions, in accordance with the common usage among Christians in speaking of the church as the "body of Christ." In the book of Revelation, xii. 7–9, in language which is symbolical whatever its precise significance may be, it is declared that "there was war in heaven: Michael and his angels fought against the dragon and his angels, who prevailed not, neither was their place found any more in heaven. And the great dragon was cast out, that old serpent, called the devil and Satan, who deceiveth the whole world: he was cast out into the earth, and his angels were cast out with him." The nature and method of this war against Satan are not explained; the fact itself is revealed with that mysterious vagueness which hangs over all angelic ministration, but also with positiveness. In addition to what the Scriptures reveal concerning the archangel there are various legends connected with his canonization as a saint in the church of Rome, where his festival, called Michaelmas, is celebrated on Sept. 29. In legendary art he is represented as young and beautiful, winged, in armor, bearing the shield and lance, with his foot on the evil one, ready to pierce and bind him. An old English gold coin bearing his image was therefore called an "angel." Of such Shakespeare speaks, when he says of a rich man, "he hath a legion of angels" in his purse.

MICHAEL, the name of six emperors of Constantinople.—I. succeeded to the throne on the death of Stauracius, in 811, who conducted a war against the Bulgarians, and was a great and just monarch; he was deposed by Leo, the Armenian, a gen. in his service, 813, and retiring to a monastery, passed the remainder of his life in devotional exercises. —II. was born in upper Phrygia, of an obscure family, but was ennobled by Leo, the Armenian. The latter, however, appears to have become angered against him, and imprisoned and condemned him to death. His life was saved by the assassination of Leo, and Michael was crowned emperor, 820. He was cruel and arbitrary; and his attempt to force his subjects to celebrate the Jewish Sabbath and passover brought about a revolt on the part of his gen. Euphemius, who proclaimed himself emperor. The rebellious gen. was slain near Syracuse, in Sicily. Michael was surnamed "the stammerer." During his reign the Saracens of Spain wrested the island of Crete from the empire, and in 827 the Aglabite Saracens seized Sicily. Michael died, 829.—III succeeded his father, Theophilus, in 842, under the regency of his mother, Theodora, whom he compelled, with her daughters, to enter a convent. In his reign the Russians first appear as foes to the empire; and the foundation for the separation of the eastern and western churches was laid by a quarrel between the patriarch Photius and the pope Nicholas I. Michael was assassinated by Basil the Macedonian in 867.—IV. surnamed the Paphlagonian, from the place of his birth, was raised to the throne by the empress Zoe, who, on account of her infatuation for him, murdered her husband He was successful in wars against the Saracens and Bulgarians, but retired to a monastery, where he died in 1041.—V. succeeded the last-named, who was his uncle. Having exiled the empress Zoe, who desired to marry him, he was overthrown by the people, and after having his eyes put out, was sent to a monastery.—VI. succeeded the empress Theodora in 1056, but retained the throne only a year, when he was compelled to resign in favor of Isaac Comnenus, while he retired to a monastery. Michael VI. was surnamed Stratioticus, and with him the Macedonian dynasty became extinct, his successor being of the family Comneni.

MICHAEL, or MIKAIL, ROMANOFF. See ROMANOFF, *ante.*

MICHAEL VI., surnamed PALÆOLOGUS, emperor of Constantinople. See PALÆOLOGUS.

MICHAEL ANGELO (BUONAROTTI), who, in an age when Christian art had reached its zenith, stood almost unrivaled as a painter, sculptor, and architect, was born in 1474 at Chiusi, in Italy. He was of noble origin, having descended on his mother's side from the ancient family of Canossa, in Tuscany, while the Buonarotti had long been associated with places of trust in the Florentine republic. Michael Angelo learned the rudiments of painting from Bertoldo, a pupil of Domenico Ghirlandaio; and having been admitted

as a student into the seminary which was established by Lorenzo the Magnificent for the study of ancient art in connection with the collections of statuary in the Medicean gardens, he attracted the notice of Lorenzo by the artistic skill with which he had restored the mutilated head of a laughing faun, and was received into the palace of the Medici, where he spent several years. Lorenzo's death in 1492, and the temporary reverses which befell the Medici family in consequence of the incapacity of his successor, Piero, led Michael Angelo to retire to Bologna, whence he soon removed to Rome, whither his fame had preceded him. His earliest original works were a kneeling angel, executed for the grave of St. Dominic, at Bologna; the statues of Bacchus and David at Florence; and a magnificent group representing the *Mater Dolorosa*, which was placed in St. Peter's, at Rome. Next in order of time, and, according to some of his contemporaries, first in merit, ranks Michael Angelo's great cartoon for the ducal palace at Florence, which, together with the pendant executed by Leonardo da Vinci, has long since perished. This work, which represented a scene in the wars with Pisa, when a number of young Florentines, while bathing in the Arno, are surprised by an attack of the Pisans, showed so marvelous a knowledge of the anatomical development of the human figure, and such extraordinary facility in the powers of execution, that it became a study for artists of every land, and by its excellence created a new era in art. Pope Julius II. called Michael Angelo to Rome, and commissioned him to make his monument, which was to be erected within St. Peter's. Although this work was never completed on the colossal scale on which it had been designed, and was ultimately erected in the church of St. Pietro ad Vincula, it is a magnificent composition, and is memorable for having giving occasion to the reconstruction of St. Peter's on its present sublime plan, in order the better to adapt it to the colossal dimensions of the proposed monument. The pope insisted upon Michael Angelo painting with his own hand the ceiling of the Sistine chapel, and, although unwillingly, he began in 1508, and completed within less than two years his colossal task, which proved one of the most marvelous of his works. The subjects of these cartoons are taken from the book of Genesis, while between these and the representations of the persons of the Savior's genealogy are colossal figures of the prophets and sibyls. Michael Angelo's genius was too often trammeled by the unworthy tasks in which Leo X. and successive popes engaged him, the former having employed him for years in excavating roads for the transportation of marble from Carrara, and in other ignoble labors. The Florentines and Bolognese vied with the pontiffs in trying to secure his services; and to his skill as an engineer Florence was indebted for the plans of the fortifications by which she was enabled for a prolonged time to resist the attempts of the Medici to recover possession of the city after their expulsion from it. On the surrender of Florence, he returned to Rome, where his great picture of the last judgment was painted for the altar of the Sistine chapel. This colossal fresco, nearly 70 feet in height, which was completed in 1541, was regarded by contemporary critics as having surpassed all his other works for the unparalleled powers of invention and the consummate knowledge of the human figure which it displayed. After its completion, Michael Angelo devoted himself to the perfecting of St. Peter's, which, by the touch of his genius, was converted from a mere Saracenic hall into the most superb model of a Christian church. He refused all remuneration for this labor, which he regarded as a service to the glory of God. Michael Angelo died in 1563, at Rome, but his remains were removed to Florence, and laid within the church of Santa Croce. His piety, benevolence, and liberality made him generally beloved; and in the history of art, no name shines with a more unsullied luster than that of Michael Angelo.—See Vasari's *Vite de' Pittori* (English translation), and *Lives* by Duppa (1806), Harford (1857), and Wilson (1876).

MICHAEL BRADACIUS, the first Moravian bishop, at first a Hussite priest at Zamberg in the eastern part of Bohemia, in the middle of the 15th century. When the Moravian brethren left the national church and established a ministry of their own, Michael having joined them was sent with two other priests to a Waldensian colony on the frontier of Bohemia and Austria for the purpose of securing the episcopacy. They were consecrated the first bishops of the Bohemian brethren. A church council was organized of which Michael was constituted the president. After a while he resigned, and Matthias of Kunwalde became president.

MICHAELIS, JOHANN DAVID, one of the most eminent and learned biblical scholars of the 18th c., was b. on Feb. 27, 1717, at Halle, where his father, Christian Benedict Michaelis, a theologian and orientalist of some distinction, was a professor. After completing his studies at his native university he traveled in England and Holland, where he made the acquaintance of several celebrated scholars. In 1745 he became a professor of philosophy at Göttingen, and took an active part in the formation of a scientific association there. From 1753 to 1770 he was one of the editors of the *Göttinger gelehrten Anzeigen*, and for some years he filled the office of librarian to the university. During the seven years' war he was occupied in making preparations for an expedition of discovery in Arabia, which was afterwards made by Niebuhr. In the latter years of his life he was almost always in the professorial chair or at his desk He died on Aug. 22, 1791. Michaelis was a man of vast attainments in history and archæology, and his labors were of great importance in the departments of biblical exegesis and history. He may be

regarded as among the earliest of the critical school of German theologians, but he lived at too early a period to acquire anything like a consistent or systematic theory of the genesis of the Hebrew Scriptures. He loved to rationalize in details, and was never quite certain what to think about inspiration; at all events, he seeks constantly to prove how thoroughly human the Mosaic legislation was, though he does not exactly deny its claims to being considered a Divine revelation. Many of his pupils became professors, and disseminated his principles through the German universities.

Michaelis's chief works are his *Einleitung in die Göttlichen Schriften des Neuen Bundes* (2 vols. Gött. 1750; English by bishop Marsh); his *Mosaisches Recht* (6 vols. Frankf. 1770–75; English by Dr. Alexander Smith, 1814); and his *Moral* (3 vols. Gött. 1792–1823). See his *Lebensbeschreibung von Ihm Selbst Abgefasst* (Rinteln und Leip. 1793).

MICHAELMAS DAISY. See ASTER.

MICHAELMAS DAY, one of the English quarter-days for payment of rent by tenants —viz., Sept. 29. Michaelmas term is one of the four legal terms during which the English courts of law and equity sit daily for dispatch of business. It begins on the 2d and ends on the 25th of November. Michaelmas head court is the name given in Scotland to the annual meeting of heritors or freeholders of each county to revise the roll of freeholders, the duties being now discharged by the commissioners of supply.

MICHAELMAS DAY (*ante*), a day set apart according to the Roman Catholic church to offer thanks to God for the benefits received by the ministry of angels, and called Michaelmas in honor of St. Michael the archangel, whose power and vigilance saved the church from her enemies. The feast of St. Michael or Michaelmas was instituted, according to Brady, in 487, and Sep. 29 was fixed for the celebration, the day on which St. Michael's church on Mount Garganus was dedicated. There is a tradition that this feast was instituted by Alexander, bishop of Alexandria. There was a superstition in the 10th c. that on every Monday morning St. Michael held high mass in the churches. The Greek and other eastern churches, the church of England, and some other reformed churches, continue to observe the feast of St. Michael, in order, as Wheatly says in his book *On the Common Prayer*, "that the people may know what benefits Christians receive by the ministry of angels."

MICHAUD, JOSEPH FRANÇOIS, 1767–1839; b. in Savoy, educated in the ecclesiastical college of Bourg; at 19 employed in a book-store at Lyons; author, the following year, of *Voyage au Mont Blanc*, followed by other essays. In 1790 he had the good fortune to meet the comtess Fanny de Beauhaenais who persuaded him to go to Paris, where he became a hearty follower of Voltaire and Rousseau, espoused republicanism by the force of the current around him, but was at heart, and by his social liens remained, a conservative and royalist. After the fall of Robespierre he contributed to the *Quotidienne* articles so squarely favoring the restoration that it became necessary for him to leave Paris. He was arrested, condemned to death, escaped, and passed four years in Switzerland and south France, occupied in light literary work. Returned to Paris in 1799; in 1803 published the poem *Printemps d'un Proscrit*. In 1806, in partnership with a younger brother, a printer, he undertook the great work *Biographie Moderne* in which the public men who were actively engaged in the great revolution were painted with dark colors. Michaud was led into history by a request of Mme. Cotton to write an introduction to her *Mathilde*, which called for an examination of original documents on the crusades, in which he became so deeply interested that it resulted in a work entitled *Tableaux Historique des Trois Prémière Croisades*, in the form of a romance published in 1807. Michaud was made member of the French academy in 1812. After the return of Louis XVIII. he was a pronounced adherent of the old dynasty, and in the *Quotidienne*, which he then edited, advocated all the tyrannous reactions of the Bourbon government. His poems though numerous, and in their time popular with those who sympathized with his opinions, are not of a high order. His *L'Apotheose de Franklin*, 1792, is interesting to Americans. The *Dernier Règne de Buonaparte*, published in 1815, is a valuable contribution to the history of that time.

MICHAUX, ANDRÉ, 1746–1802; b. France; studied science under the botanist Jussien, and the astronomer Lemonnier. In 1779 he traveled in England, whence he brought into France some new plants and shrubs. The next year he traveled through Auvergne and the Pyrenees, and, on his return to Paris, introduced several new varieties of Spanish grain. In 1782 the count of Provence, afterwards Louis XVIII., sent him to Persia on a scientific mission. On his arrival he was robbed by the Arabs of all his effects except his books. Assisted by the British consul at Bassora he went on as far as Ispahan, where he cured the shah of a dangerous disease. After spending two years in Persia he brought back to France a fine collection of dried plants and seeds. In 1785 he traveled extensively in North America on a scientific mission at the expense of the government; but the French revolution compelled him to return for want of funds. He was shipwrecked on the voyage to France, and lost nearly all his specimens. On his arrival in Paris in 1796 the directory would give no adequate recompense for his losses. In 1800 he sailed for Madagascar, where he died. His most important publications are *Histoire des Chênes de l'Amérique Septentrionale*. 1801; and *Flora Boreali Americana*, 1803. It is said that much of the latter work is the production of prof. Louis Claude Richard

MICHAUX, FRANÇOIS ANDRÉ, 1770–1855; b. France; son of André. He came to the United States three times in the employ of the French government, and made explorations among the North American forests for the purpose of bringing into Europe new varieties of trees. His *Histoire des Arbres forestiers de l'Amérique Septentrionale* contains the results of his American explorations, and gives an account of the distribution and the scientific classification of the principal American timber-trees, and the nature and uses of their timber. He also wrote a work *On the Naturalization of Forest Trees in France; Journey to the West of the Alleghany Mountains;* and *A Notice of the Bermudas.*

MICHEL, FRANCISQUE XAVIER, b. in Lyons, 1809, and there educated. He went to Paris on the completion of his school studies, contributed articles to several journals, and soon became interested in the literature of the middle ages. In 1830 he was sent by Guizot to England to examine documents pertaining to the ancient history of France. In 1837 he was in Scotland on the same mission. In 1839 Michel was called to the professorship of foreign literature at Bordeaux. He is member of the académies of inscriptions of Paris, Turin, and Vienna; and of the society of antiquaries of France and London. Among his original works are: *Job, ou les Pastoureaux*, 1832; *Histoire des Croisades*, 1833; *Deux Armées du Règne de Henri II., roi d'Angleterre* 1841; *Histoire des Races Maudites de la France et de l'Espagne*, 1847, 2 vols., an unique contribution to history; *Les Ecossais en France, et les Français en Ecosse*, 1862, 2 vols.; etc.

MICHELET, JULES, a brilliant French historian, b. at Paris, Aug. 21, 1798. He studied with great success under Villemain and Leclerc, and at the age of 23 became a professor in the collége Rollin, where he taught history, philosophy, and the classics. In 1826 he published *Les Tableaux Synchroniques de l'Histoire Moderne*, and was named master of conferences (*Maître des Conférences*) at the *ecole normale*. After the revolution of 1830 he was chosen head of the historic section, intrusted with the care of the archives of the kingdom, assistant to Guizot at the Sorbonne, and tutor to the princess Clémentine, daughter of the French king, and published several valuable books, such as *Précis de l'Histoire Moderne* (1833, of which there have been more than 20 editions); *Précis de l'Histoire de France jusqu'à la Révolution Française* (the 7th edition of which appeared in 1842); *Mémoires de Luther* (1835); *Origines du Droit Français cherchées dans les Symboles et Formules du Droit Universel* (1837). In 1838 he succeeded Daunau in the collége de France, and comte Reinhard in the professorship of moral philosophy. He now plunged into controversy with all the vivacity and impetuosity of his nature. The Jesuits were the grand objects of his dislike; and eloquence, sarcasm, sentiment, and history were all brought to bear upon them with brilliant effect. Three books were the fruits of his polemic: *Des Jésuits*, in conjunction with Edgar Quinet (1843); *Du Prêtre, de la Femme, et de la Famille*, (1844); *Du Peuple* (1846). In 1847 appeared the first volume of his *Histoire de la Révolution;* and it was finished in 1853, in 6 vols. When the affair of 1848 broke out, acting more wisely than most of his learned *confrères*, he declined to take an active part in political struggles, and quietly pursued his literary avocations. He, however, lost his situation in the archives office after the *coup d'état*, by refusing to take the oath of allegiance to Louis Napoleon. Other works of his were *L'Oiseau* (1856); *L'Insecte* (1857); *L'Amour* (1858); and *La Femme* (1859); *La Mer* (1861); *La Sorcière* (1862); *La Bible de l'Humanité* (1864); and *Nos Fils* (1869), a plea for compulsory education. His masterpiece is his *Histoire de France*, continued in *Histoire de la Révolution Française*, and *Histoire du XIXme Siècle.* Michelet died in 1874.

MICHELET, KARL LUDWIG, b. Berlin, 1801; graduated at the university of Berlin, receiving the degree of PH.D. in 1824. The following year he was appointed professor of philology and philosophy in the French gymnasium, and continued to hold this position for twenty-five years. During a portion of this period he was also professor of philosophy in the university of Berlin. He published a large number of works on metaphysical subjects, including the following: *System der philosophischen Moral; Die Ethik des Aristoteles; Geschichte der letzten Systeme der Philosophie in Deutschland von Kant bis Hegel; Anthropologie und Psychologie;* etc. From 1860 he edited the Berlin *Gedanke*, representing the philosophical society of that city.

MICHELIS, FRIEDRICH, b. Germany, 1815; educated to the profession of theology; ordained a priest at Munster, his birthplace, and became a private tutor. In 1864 he received the appointment of professor of philosophy at the lyceum of Braunsberg. Two years later he was an opponent of the ecclesiastical policy of Bismarck in the Prussian chamber. Notwithstanding this fact, he also opposed the Jesuitical influence and the dogma of the infallibility of the pope; publishing several pamphlets in support of his views, and incurring the displeasure of Rome, and eventually excommunication. He wrote in opposition to the theories of Darwin, and his intention appears to have been to reconcile the teachings of modern science with the doctrines of the Roman Catholic church. His most important work is *Die Philosophe Platon's in ihrer innern Beziehung zur Geoffenbarten Wahrheit.* He has of late edited an anti-Jesuit publication called *Der Katholik.*

MICHIGAN, a lake in the United States, the second in size of the five great fresh-water lakes, and the only one lying wholly in the United States, having Michigan on the n. and e., and Wisconsin on the west. It is 320 m. long, 70 m. in mean breadth, and 1000

ft. in mean depth. It is 578 ft. above the level of the sea, and has been found by accurate observations to have a lunar tidal wave of 3 in. It is the outlet of numerous rivers, and is connected by a canal, and sometimes by flooded rivers, with the Mississippi, which is believed to have been its ancient outlet. Its principal harbors are those of Chicago, Milwaukee, and Grand Haven; and its bold and, at certain seasons, dangerous shores are guarded by 23 light-houses. It forms, with the lower lakes and the St. Lawrence, a natural outlet for one of the richest grain-growing regions in the world.

MICHIGAN, LAKE (*ante*), containing an area of about 22,400 sq.m., 2,000 sq.m. larger than lake Huron. Its banks are low and sandy, containing rocky sections of sandstone and limestone, but no high bluffs. Inland the sand hills rise to the height of 150 ft. Its waters are wearing away the Wisconsin shores and leaving land on the Michigan side. Its outlet is through the straits of Mackinaw into lake Huron at its n.e. extremity, near the old trading-post of Mackinaw. Racine, a city of Wisconsin at the mouth of the Root river, and Manitowoc, Wis., at the mouth of a river of its own name, are among the larger cities on its borders. The best harbors are in the bays, and are artificially formed. Its islands are in the n. portion; the largest, Beaver island, 50 m. long, and the Fox islands in the n.e. It has 2 large bays—Green bay, 100 m. long, and Grand Traverse bay, 30 m. long, and 3 of lesser dimensions, Little Traverse bay, Little bay of Noquet, and Big bay of Noquet. It has important fisheries; white-fish and large trout are taken and exported in large quantities, fresh and canned. The largest rivers which empty into it are the St. Joseph, the Muskegon, the Grand, emptying into the lake at Grand Haven; the Kalamazoo, 200 m. long, the Manistee, 50 m. long, all in Michigan; the Fox in Wisconsin, and the Menomonee in Wisconsin, emptying into Green bay.

MICHIGAN, one of the United States, lying in lat. 41° 40′ to 48° 20′ n., and long. 82° 25′ to 90° 34′ west. It is bounded on the n. by lake Superior and St. Mary's river; e. by lake Huron, river and lake St. Clair, Detroit river, and lake Erie; s. by the states of Ohio and Indiana; and w. by lakes Michigan and Wisconsin, and has an area of 56,243 sq.m., or 35,995,520 acres. It is divided into 77 counties. The capital is Lansing; the chief towns are Detroit, Grand Rapids, East Saginaw, Jackson, Bay City, Saginaw City, etc. Michigan is divided by lakes Michigan and Huron into two irregular peninsulas—the upper, a wild and rough region of mountains and forests, containing about one-third the area of the state, lies between the northern portions of lakes Michigan and Huron, and lake Superior; while the lower is nearly inclosed in a vast horse-shoe bend of lakes Michigan, Huron, Erie, and the connecting straits and rivers. In the upper peninsula are the Porcupine mountains, rising to a height of 2,000 ft. with sandy plains and forests. The southern is a level, rich, fertile country of prairies and oak-openings, watered by numerous rivers, as the Grand, Kalamazoo, Muskegon, Saginaw, etc. The lower peninsula is of limestone strata, with coal and gypsum; the upper, of azoic formations, with metamorphic slates, gneiss rocks, trap, and rich mines of copper and iron. The climate is mild in the southern, and cold and bleak in the northern regions. The southern portion produces wheat, maize, fruits, butter, cheese, and wool in great abundance. Vast quantities of pine lumber are exported from the northern half of the state. The principal manufactures are flour and woolens. The extensive coast and rivers afford great facilities to navigation, while several railways traverse the state. The government is similar to those of the other states, and the school system is based on that of Prussia, with abundant revenues from public lands. The university of Michigan at Ann Arbor has 44 professors, and a foundation of 1,000,000 acres of land. The only charge to students who are resident in Michigan is $10 admission, and $15 annual fee. Detroit was settled by the French in 1610, who also established a trading-port at Mackinaw at about the same period. The British took Detroit in 1812, but restored it at the end of the war. The state was admitted to the union in 1837. Pop. '40, 212,267; 50, 397,654; '70, 1,184,296.

MICHIGAN (*ante*) derives its name from two Chippewa words, *mitchi* and *sawgyegan*, meaning "lake country." The discoverers and first settlers of the territory were the French missionaries and fur-traders, some of whom visited the site of Detroit as early as 1610, while in 1641 some French Jesuits found their way to the falls of the St. Mary. The first actual settlement by Europeans within the limits of the state was the mission at Sault Ste. Marie, founded by father Marquette and others in 1668. Three years later fort Michilimackinac (now Mackinaw) was established. Detroit was founded in 1701 by an expedition under Antoine de la Mothe Candillac. The territory fell into the hands of the English with other French possessions in 1763. After this event the Indian chief Pontiac organized a conspiracy to exterminate the whites, when a bloody conflict ensued. The garrison at Mackinaw was butchered, and Detroit was subjected to a long siege. It was not until 1796, 13 years after the peace of 1783, that the United States took actual possession of this region, though it was included within the boundaries of the northwest territory, so-called, and amenable to the ordinance of 1787. Afterwards it formed for a time a part of the territory of Indiana. In 1805 it was erected into a separate territory, with substantially its present boundaries, gen. William Hull being appointed governor. During the war of 1812–15 the inhabitants were sorely harassed by the Indians and the British. Gen. Hull surrendered Detroit to the British under circumstances which led to his trial and condemnation to death by court-martial. The sentence was not executed, how-

ever, and facts afterwards came to light which partially, or it may be wholly, relieved him from blame. Mackinaw was also captured, and at Frenchtown, early in 1813, a number of American prisoners were massacred by the Indians. Shortly afterwards gen. Harrison succeeded in driving the British out of the territory, and in 1814 a truce was concluded with the Indians. In 1816–17 a considerable portion of the territory was surveyed, and in 1818 a large body of land was offered for sale. In 1819 the territory was authorized by act of congress to send a delegate to that body. At different times from 1819 to 1836 the Indians ceded large tracts of land to the territory, and at the last-named date all the lower and a part of the upper peninsula had been freed from Indian titles. Partly in 1818 and partly in 1834 the territory now forming the state of Wisconsin was annexed to Michigan; but in 1836 it was erected into a territory by itself, and Michigan was reduced substantially to its original boundaries. Previous to 1823 the legislative power was vested in the governor and judges, but in that year it was transferred to a council consisting of 9 persons selected from 18 chosen by the people of the territory. In 1825 the council was increased to 13 members chosen upon the same plan, but in 1827 the law was changed so as to provide for the election of the councilors by the popular vote. In 1831 gen. Cass was succeeded by George B. Porter as governor, and the latter, dying in 1834, was succeeded by Stevens T. Mason. In 1835 a state constitution was adopted by a convention called for the purpose. It claimed jurisdiction over a strip of land also claimed by Ohio. There was danger that the dispute would lead to bloodshed, but in 1836 congress agreed to admit Michigan to the union upon condition that she should surrender her claim to the disputed territory and accept in lieu thereof a larger area in the upper peninsula. The first convention called to consider this proposal rejected it, but it was accepted by a second in Dec., 1836, and in January following Michigan was admitted to the union as a state. In 1847 the seat of government was removed from Detroit to Lansing, the latter at that time being in a dense wilderness. It is now a flourishing town, and the state capitol is one of the largest and finest structures of the kind in the United States.

Michigan is comprised in two peninsulas of irregular shape, separated from each other by the strait of Mackinaw, connecting lake Michigan with lake Huron. The largest of these peninsulas embraces the whole territory lying between these two lakes, and at its s.e. corner touches lake Erie. From lake Erie to the southern end of lake Huron it is divided from Canada by the Detroit and St. Clair rivers, the latter flowing into the former through lake St. Clair. The great mass of the inhabitants of the state at the present time dwell on the southern half of this peninsula, the northern portion, together with the whole of the upper peninsula, being very sparsely inhabited.

The upper peninsula, containing a little more than one-third of the state's area, is rugged and broken, and in parts mountainous. The Porcupine range of mountains is the watershed between the streams flowing into lake Superior and those flowing into lake Michigan. This range at its highest point is 1400 ft. above lake Superior—2,000 ft. above the sea. The surface on each side of the mountains presents a rugged aspect, with some picturesque scenery and considerable variety of soil. At the eastern end the mountains at their highest points do not rise more than 400 ft. above lake Superior. There are numerous lakes and marshes, and great forests, where pine and other soft woods are the prevailing growths, though fine groves of sugar-maple are found in some places. In some portions of the peninsula the forests have been destroyed by fire, thus transforming the region into a desert. The n.w. extremity of the peninsula is celebrated for its extensive deposits of copper and iron. The sugar-maple is found here in great abundance and of the best quality, but the soft woods are scarce. The land is generally sterile. The northern peninsula is 318 m. in length from e. to w., and from 30 to 160 m. in width, and in 1874 contained 61,814 inhabitants.

The southern peninsula, or Michigan proper, is in almost every respect a contrast to the northern. The surface is generally level, though in the s. it is broken by low conical hills rising from 30 to 200 feet. The length of the peninsula from s. to n. is about 275 m., its width 259 miles. It is unequally divided by a low water-shed extending from s. to n., and rising at the highest point from 600 to 700 feet. The larger portion of the peninsula lies w. of this water-shed, which slopes gradually towards lake Michigan. The shores on both sides are in many places steep, curving picturesquely around numerous bays and inlets. On lake Michigan they are frequently broken by bluffs and sand-hills from 100 to 300 ft. high. The s. portion of the peninsula is very fertile, the n. portion less so.

The islands in the state are numerous. The principal of these are isle Royal and Grand isle in lake Superior; Sugar and Nebish islands in St. Mary's strait, and Drummond island at its mouth; Marquette, Mackinaw, and Bois Blanc islands near the n. end of lake Huron; and the Beaver, Fox, and Manitou groups in the n. end of lake Michigan. The principal rivers are the Cheboygan, Thunder Bay, Au Sable, and Saginaw, flowing into lake Huron; the Huron and Raisin, into lake Erie; the St. Joseph, Kalamazoo, Grand, Muskegon, Manistee, Grand Traverse, Manistique, and Escinaba, into lake Michigan; and the Ontonagon and Tequamenon, into lake Superior. Most of these rivers are small, though several are navigable for short distances. Many small ponds are scattered through the state.

There is a coal field of 12,000 sq.m. in extent in the s.e. part of the state, but the veins are so far below the surface that they cannot be worked to advantage. The supplies of

fuel for the iron-works on lake Superior are more cheaply obtained from Ohio. Limestone is abundant, and on the shores of lake Huron, in the n. part of the state, are formations which yield excellent grindstones. In the valley of Saginaw river salt is obtained by boring. The most productive copper region in the world, except that of Chili, is at the n.w. end of the upper peninsula. The veins sometimes bear silver in small quantities. The copper mines are mainly in the counties of Ontonagon, Houghton, and Keweenaw. The iron mines are principally in Marquette county. In the peninsula are remains of ancient mines and mining implements, which justify the presumption that at some distant period in the past the country was occupied by a race advanced in civilization.

Among the natural curiosities of the state are the "pictured rocks," so-called, on the shores of lake Superior, not far w. of Sault Ste. Marie. They are sandstone rocks worn by the water into picturesque shapes, resembling old castles, temples, arches, etc., which, viewed from a steamer's deck, are impressive and wonderful. In some instances the upper surface of these bluffs projects so far over the lake that steamers pass directly under them, and behind cascades which fall from the summits.

The climate of the lower peninsula is so tempered by the proximity of the lakes that it is much milder than that of other regions in the same latitude. The northern peninsula in winter is very cold. The average annual difference of temperature between the two peninsulas is 7°. Oak openings and prairies are the most characteristic feature of the lower peninsula. In the forests the prevailing growths are the sugar-maple, oak, walnut, ash, hickory, elm, linden, locust, dogwood, beech, sycamore, cherry, pine, hemlock, spruce, tamarack, cypress, cedar, and chestnut. In the n. portion of the peninsula the white pine is a source of wealth. The soils on the lower peninsula are well adapted to the production of fruit. Apples are produced in large quantities. Peaches grow well on the shores of lake Michigan, while grapes are extensively produced on the shores of lakes Michigan and Erie, and in the river valleys. Pears, quinces, plums, cherries, and the small fruits generally, are raised in perfection in the interior as well as on the borders of the lakes.

The extensive forests of northern Michigan are a covert for large numbers of wild animals, among which are the black bear, wolf, lynx, wildcat, panther, fox, weasel, marten, badger, skunk, mink, otter, raccoon, opossum, beaver, marmot, hare, rabbit, and squirrel. Deer are plenty in some parts, and the elk is not yet extinct. The birds are of great variety, and the waters of the state are well stocked with edible fish.

As an agricultural state Michigan ranks high. The number of farms in 1879 was 111,822, embracing 5,785,102 acres of improved and 4,530,486 of unimproved land—in all, 10,315,588 acres. Number of horses, 272,603; of milch cows, 291,243; of other cattle, 338,910; hogs, 493,109; sheep, 1,772,312; number of acres in apple orchards, 229,262; in peach orchards, 10,771. The latest crop statistics are those of 1878, from which the following items are gathered: Bushels of wheat raised, 29,511,889; corn, 36,663,299; oats, 13,454,517; clover-seed, 166,465; barley, 806,463; peas, 641,061; potatoes, 6,190,406; tons of hay, 1,124,931; lbs. of wool, 8,666,467; bush. of apples sold, 3,944,206; of peaches, 107,244; lbs. of grapes sold, 1,014,950; bush. of cherries, currants, plums, and berries, 100,493. The cash value of farms in 1870 was estimated at $398,240,578; of farming implements and machinery, $13,711,979; wages paid during the year, $8,421,161; value of farm productions, $81,508,623; of orchard products, $3,447,985; of produce of market gardens, $352,658; of forest products, $2,559,682; of home manufactures, $338,000; of animals slaughtered or sold for slaughter, $11,711,624; of live stock, $49,809,869. In 1873 there were sold, of dried fruits, 2,664,709 lbs.; of cider, 182,347 bbls.; of wine, 50,858 galls.; of 2-lb. cans of fruit, 1,003,803; of maple sugar, 4,319,793 lbs. The aggregate value of real estate assessed in 1875 was $308,753,036; of personal property, $66,127,992. These figures are supposed to represent but one-third of the real value of the property.

According to the census of 1870 there were in the state 9,455 manufacturing establishments, giving employment to 63,694 persons, of whom 2,941 were females above 15, and 2,406 were under that age. The capital invested was $71,712,283; wages paid, $21,205,355; value of products, $118,394,676. The principal industries, with the value of their products respectively in 1870, were, Agricultural implements, $1,569,596; blacksmithing, $1,581,357; boots and shoes, $2,552,931; carpentering and building, $3,976,333; carriages and wagons, $2,393,328; railroad cars, $1,488,742; clothing, $2,577,154; cooperage, $1,176,768; copper, milled and smelted, $9,260,976; flouring and grist mill products, $21,174,247; furniture, $1,953,888; iron products, $4,938,947; leather, $2,670,608; distilled and fermented liquors, $1,321,286; lumber, planed and sawed, $33,078,241; machinery, $2,330,564; printing and publishing, $1,071,523; salt, $1,176,811; sash, doors, and blinds, $1,868,596; tobacco and cigars, $2,572,523; woolen goods, $1,209,518. Other industries, the products of which ranged from $96,000 to $967,000 respectively, were masonry, brick and stone; tin, copper, and sheet-iron ware; wooden ware; ship-building; meat packed; paper; saddlery and harness. The lumber statistics of 1879 show: Number of mills, 64; men employed, 4,003; lumber cut, 2,289,066,855 ft.; shingles cut, 685,619,150. The salt product of 1879 was 2,058,040 bbls.; the wheat product, 10,290,200 bush.; product of iron mines, 1,453,765 tons, valued at $7,413,114. The total product of the copper mines in 1877 was 24,958 tons; total product from 1845 to 1877 inclusive

289,188 tons; ingot copper, 1877, 19,966 tons, valued at $7,586,480; total value of product from 1845 to 1877, $116,928,280; total assessments from 1845 to 1877 by working mines, $3,960,000; total dividends paid in same time, $21,780,000; dividends paid in 1877, $1,740,000. The catch of fish from the lakes in 1870 was valued at $567,576.

The value of foreign imports in 1874 was $2,353,786; of exports, $9,526,629; number of vessels which entered the ports of the state, 4,682—tonnage, 1,420,317; vessels cleared, 4,718—tonnage, 1,431,355. The foreign trade is almost entirely with Canada. The exports consist for the most part of grain, flour, hogs, lumber, beef, pork, tobacco, cotton, and railroad cars. The vessels registered in the state in 1874 were: sailing, 368, of 52,907 tons; steamers, 358, of 68,239 tons; vessels built: steamers, 34, of 8,834 tons, sailing, 42, of 15,383 tons.

The railroad statistics for 1878 were as follows: Miles of track, 3,564; capital stock paid in, $148,152,011; total debt, $161,373,748; cost of roads and equipment, $154,256,078. The railroad interests are represented by 41 distinct corporations, but the roads are actually managed by 27 companies. Of the 11,552 stockholders 4,550 reside in the state, holding $4,685,819 of the more than $147,000,000 of capital. But 5 of all the roads paid dividends in 1878, viz.: the Chicago and Northwestern; Detroit Lansing and Northern; Lake Shore and Michigan Southern; Michigan Central; and Mineral Range. There is a ship-canal about a mile long around the falls of the St. Mary's at Sault Ste. Marie, which is of great advantage in facilitating commerce between lakes Superior and Huron; and another, two miles long, connecting Portage lake with lake Superior on the w. side of Keweenaw point. The first of these canals was opened in 1855, the second in 1873.

In 1873 there were in Michigan 77 national banks, with a capital of $9,802,200; and a circulation of $7,139,217. In 1879 there were 14 state and 14 savings-banks. The capital of the former was $874,400; resources of the latter, $7,958,675. The number of insurance companies authorized to transact business in Michigan in 1878 was 195, of which 50 were incorporated under the laws of the state. One of these was a life insurance company, with assets amounting to over $900,000, and risks amounting to $11,641,000. Two stock fire companies had risks amounting to $22,000,000; 47 farmers' mutual fire companies, with 57,000 members, had at risk $107,000,000. From 1870 to 1877 the aggregate business of stock fire companies in the state was as follows: Risks, $1,210,261,365; premiums received, $17,071,744; losses, $9,817,689. During the same period these companies paid to the state in taxes about $500,000. The number of life insurance companies of other states doing business in Michigan in 1878 was 28. The whole number of policies on the lives of citizens of the state was about 22,000, representing insurance to the amount of $42,000,000.

Michigan takes a high rank in all matters pertaining to education. The school statistics for the year ending Sept. 1, 1879, were as follows: Number of school districts, 6,248; children of school age, 486,933; whole number attending school, 342,018; number of teachers, 18,616; total wages of teachers, $1,880,945; average monthly wages of male teachers, $38.69; of female teachers, $23.48. Amount of moneys from preceding year, $729,744; received from two-mill tax, $494,011; from primary school fund ($2,743,519), $229,384; from district taxes, $2,049,755; from all other sources, $340,893—total receipts for the year, $3,843,790. Expenditures: Male teachers, $712,594; female teachers, $1,160,865; for building and repairs, $864,135; bonded indebtedness, $329,466; all other purposes, $497,576. The state normal school, opened in 1853, has graduated nearly 1000 teachers. It is well organized and efficiently managed, having four courses of instruction—common school, full English, ancient languages, and modern languages. Few states of the union have made more ample provision for the higher education of youth than Michigan. High schools or academies, supported by state funds and taxes, are established in all the larger cities and towns; the state university at Ann Arbor, one of the foremost of American colleges in respect both of its endowments and courses of instruction, went into operation in 1842, and is open to students of both sexes on equal terms. The state agricultural college, near Lansing, affords instruction for those who wish to fit themselves for agricultural pursuits. Besides these there are six other colleges under the patronage of different religious denominations, nearly all of which are open to students of both sexes. There are for women several seminaries of a high grade. The professional schools equal the best elsewhere.

The bonded debt of the state in 1879 was $913,149; and at the same time there were on hand applicable to its payment funds amounting to $912,000. The total resources of the state, applicable to ordinary expenses, amounted in 1879 to $2,626,153; the expenses of the year were $2,019,885, leaving a balance of $606,267. The trust funds (mainly for educational purposes) for which the state is accountable amount to $3,419,145. The new capitol at Lansing, costing $1,390,000, the corner-stone of which was laid in 1873, was dedicated Jan. 1, 1879.

In 1873 there were in the state 253 newspapers and periodicals, of which 22 were dailies, 3 tri-weeklies, 209 weeklies, 2 semi-monthlies, 1 fortnightly, and 16 monthlies. According to the census of 1870 the whole number of libraries was 26,763, of which 23,761 were private; total number of volumes reported, 2,174,744, of which 1,196,113 were in the private libraries; 423 town and city libraries had 14,207 volumes; 246 school

and college libraries, 37,734 volumes; public school libraries,125,331 volumes; 1731 Sunday-school libraries, 239,471 volumes; 436 church libraries811,891 volumes; 116 circulating libraries, 53,704 volumes.

The principal charitable, reformatory, and penal institutions of the state are: the Michigan asylum for the insane at Kalamazoo, organized 1854; the eastern Michigan asylum, founded at Pontiac, 1873; the Michigan state retreat for the insane, near Detroit, under the care of the sisters of charity; the institution for the deaf and dumb, at Flint; the state asylum for the blind (now nearly completed); the state public school at Coldwater, designed to "provide for all the dependent children of the state, whether in or out of the county poor-houses, who are sound in body and mind, to maintain and educate them while temporarily in the school," and until homes can be provided for them; the state reform school at Lansing; the state house of correction at Ionia; the reform school for girls; the Detroit industrial school; the state prison at Jackson.

The population of Michigan has risen from 551 in 1800 to 1,636,331 in 1880. The inhabitants of foreign birth numbered in 1870 only 268,000. The number of males in 1874 was 697,184; of females, 636,847. The governor and other state officers are elected once in two years, the day of election being the Tuesday after the first Monday in November. The governor's veto can be set aside by a vote of two-thirds of both houses of the legislature. The legislative power is vested in a senate of 32 and a house of representatives not exceeding 100 members, elected for two years, and meeting every alternate year on the first Wednesday of January. The supreme court consists of a chief-justice and three associate justices, elected for 8 years, and eligible to re-election. The court has both appellate and original jurisdiction. There are 14 circuit courts, each presided over by one judge, elected for 6 years; they have original jurisdiction in all matters civil and criminal, and appellate jurisdiction from all inferior courts. The salaries of the supreme court judges are $4,000 per annum, those of the circuit court judges, $1800. A probate judge is elected in each county for 4 years; justices of the peace in every township for the same term. The church organizations in 1870 numbered 2,239; church edifices, 1415; church property, $9,133,816. The principal denominations are: Baptist, Freewill Baptist, Christian, Congregational, Episcopal, Evangelical Association, Friends, Disciples, Jews, Lutheran, Methodist, Presbyterian, Reformed Dutch, Reformed German, Roman Catholic, Second Advent, Spiritualist, United Brethren in Christ, Unitarian, and Universalist.

The electoral votes of Michigan for president and vice-president of the United States have been cast as follows: 1836, 3 for Van Buren and Johnson; 1840, 3 for Harrison and Tyler; 1844, 5 for Polk and Dallas; 1848, 5 for Cass and Butler; 1852, 6 for Pierce and King; 1856, 6 for Fremont and Dayton; 1860, 6 for Lincoln and Hamlin; 1864, 8 for Lincoln and Johnson; 1868, 8 for Grant and Colfax; 1872, 11 for Grant and Wilson; 1876, 11 for Hayes and Wheeler; 1880, 11 for Garfield and Arthur.

MICHIGAN CITY, a t. in Indiana, on the s. shore of lake Michigan and on the Michigan central railroad, at the junction of the Louisville, New Albany, and Chicago railroad with the Indianapolis, Peru, and Chicago; pop., '70, 3,985. It is delightfully situated at the mouth of Trail creek, about 38 m. from Chicago by water, 56 m. by rail, 13 m., n.w. of La Porte, and 140 m., n.w. of Indianapolis. It is the center of an important trade in salt and lumber, and the commerce of the lake, and as a shipping point for iron ore. It contains the northern state prison, has two newspapers, and a national bank. It has good schools and is the seat of Ames college. Its industries are the manufacture of lumber, wagons, boots and shoes, and furniture; and it has planing mills, foundries, locomotive works, and the railroad repair shops of the lines which center there.

MICHIGAN STATE AGRICULTURAL COLLEGE, at Lansing the capital of the state, is the oldest of all the institutions of the kind in the country. It was established in obedience to a direct provision of the constitution of the state, Feb. 12, 1855, and opened to students May 13, 1857. It is endowed by the sale of lands given by the general government to the state in 1862. Of the 235,673 acres so given, 86,121 acres have been sold, forming a fund of $275,104, on which the state pays 7 per cent interest to the college for its current expenses. The annual income of about $18,000 is supplemented by liberal appropriations on the part of the state. The property of the college, exclusive of the lands and endowment fund, is $275,000. The college buildings stand in a park of about 100 acres, being a part of its farm of 676 acres. The principal buildings are a college hall for chapel, library, general museum, and class rooms, two dormitories with the armory in one of them, a chemical laboratory, a botanical laboratory, a greenhouse with propagating houses attached, an apiary, 5 farm barns, piggery, carpenter's shop, 5 dwelling houses. It has farm gardens of various kinds, botanical grounds, an arboretum, orchards, stock, etc. Its collections in natural history and its apparatus are of considerable value. Its library contains about 5,000 bound volumes and 900 pamphlets. The college has but one course of study, four years in length, embracing, besides agriculture, horticulture, and the sciences connected therewith, the elements of a general education. It has 7 professors, and 6 other officers, 232 students; and 205 alumni. Women are admitted into the classes, and one woman has been graduated. Students are required to labor three hours each day, Saturdays and Sundays excepted, and for the most of this labor a small compensation is given. The state has on deposit arms and accouterments.

and a volunteer military company drills once (usually twice) a week. There is no preparatory department. President, T. C. Abbot.

MICHIGAN, UNIVERSITY OF, at Ann Arbor, Washtenaw co., Mich., was founded in 1837, though not opened until 1842. Its first endowment was the gift by congress in 1826 of two townships of land. It is supported by the state, and open to students of both sexes, without charge for tuition, on payment of a small matriculation fee and the annual payment of $15. It is a part of the public educational system of the state, the constitution providing for the perpetuation of the governing body of the institution, the board of regents. It aims to complete and crown the work which is begun in the public schools, by furnishing ample facilities for liberal education in literature, science and the arts, and for thorough professional study of medicine, law, and dentistry. While Michigan has endowed her university primarily for the higher education of her own sons and daughters, she also opens its doors to all students, wherever their homes. Students from other states are asked to pay a larger admission fee than students from Michigan, but in all other respects their advantages are the same. The university comprises the department of literature, science and the arts, the department of medicine and surgery, the department of law, the school of pharmacy, the homœopathic medical college, and the dental college. Each of these departments and colleges has its faculty of instruction, who are charged with the special management of it. The university senate is composed of all the faculties, and considers questions of common interest and importance to them all. Post-graduate courses are provided for the graduates of this university, or for the graduates of any college or university who may desire to pursue advanced study whether for a second degree or not. The school of pharmacy is a distinct school, having a regular course of two years. The libraries of the university accessible to the students, amount, in the aggregate, to about 36,000 volumes. The astronomical observatory contains the large meridian circle constructed by the famous makers, Pistor & Martins, of Berlin, one of the largest and best of the kind; a sidereal clock, made by Tiede, of Berlin; the collimators for the meridian circle; the library of the observatory, and the smaller instruments. One of these is a chronograph with Bond's new isodynamic escapement, for recording observations by the electro-magnetic method. In the dome is mounted a large refracting telescope, with an object glass 13 in. in diameter, constructed by the late Henry Fitz, of New York. A set of self-registering meteorological instruments has recently been added. It consists of Hough's barograph and thermograph, Robinson's anemometer with Gibbons's self-registering attachment and an anemograph. Means have been provided for the erection of a small observatory for the purpose of instruction, on the observatory grounds near the main building. A fire-proof museum building 127 by 47 ft., has just been erected. The collections in the museum embrace 6,000 mineralogical specimens; a geological cabinet, with 41,000 specimens; zoölogical cabinet with over 110,000 specimens; a botanical cabinet, containing 10,000 species, 20,000 entries, and 70,000 specimens; exhibitions in archæology and relics, embracing memorials of the native Indian tribes; collection in department of fine arts and history, embracing a gallery of casts of the most valuable ancient statues and busts, terra cotta models, gallery of engravings and photographic views executed in Italy and Greece, historical medallions, and copies of modern statues, busts and reliefs by the great masters. The anatomical museum is rich in valuable specimens. There are no dormitories and no commons connected with the university. The university (1880) is served by 36 professors, 9 assistant professors, and 16 lecturers and assistants. Number of students in 1880: department of literature, science and art, 448; department of medicine and surgery, 350; department of law, 395; school of pharmacy, 81; homœopathic medical college, 70; college of dental surgery, 83; total, 1427. President, James B. Angell, LL.D.

MICHILIMACK'INAC. See MACKINAW, *ante*.

MICHOACAN', or MECHO'ACAN, a political division, or state of Mexico, extending over the table-land of the same name, and the low country lying between it and the Pacific, and a portion of the hilly country s. of these districts; 21,609 sq.m.; pop. '68, 618,240. Its n.e. districts are watered by the river Santiago. The Sierra Madre and its branches traverse it in all directions; and within its territory are the lake of Patzcuaro, the peak of Tancitaro, and the volcano of Xorullo (Jorullo). The Cerro de Santa Rosa, in the district of Tlapujahua, about 17,000 ft. in height, is the highest point. The mountain ridges are divided by fertile valleys, drained by the Lerma, Mescala, and other rivers, and numerous mountain streams. The largest lakes are the Patzcuaro, already named, 30 m. in circumference; and Chapala, which is 60 m. long by 20 wide. The coast line is 100 m. in extent, the only ports being San Telmo, Maratua, and Buceria. The state is divided into 17 districts; the climate is very variable, the mean annual temperature in the capital being 71° F. The country has large mineral deposits, including gold, silver, copper, iron, coal, cinnabar, lead, sulphur, emery, lithographic stone, and copperas. The mines are but little worked, the annual yield being at present a little more than one million dollars, that of silver being one-third of the amount. In the districts along the n. boundary line carbonate of soda is collected. There are manufactures of importance, including sarapes (Mexican shawls), blankets, silver ware, flour, and glass. Cabinet and dye-woods are exported; also coffee, indigo, silk, gold, silver, and copper, chiefly to contiguous states and to Guatemala. Education is conducted in this state through a system

including a state college, 53 girls' schools, and 28 for boys. Capital, Morelia (formerly Valladolid).

MICIPSA. See JUGURTHA, *ante*.

MICKIEWICZ, ADAM, 1798–1855; b. Poland; son of a Lithuanian nobleman, who pursued unsuccessfully the profession of an advocate. Mickiewicz received his elementary education at the schools in Nowogrodek and Minsk, and in his eighteenth year entered the university of Wilna, where his uncle was a professor. This university, for whose regency the poet Campbell was at one time a candidate, was then the most important educational institution in Russian Poland. There Mickiewicz became acquainted with the Polish revolutionist, Thomas Zan, and joined one of the patriotic secret societies which Zan was forming at Wilna. He gave most of his time, while at the university, to chemistry and poetry; his first published poem was addressed to Lelewel, university professor of history, and an ardent Polish patriot. After leaving Wilna, he became professor of classical literature in the college at Kowno, and it was during his residence there that two volumes of his poems were published, in 1822. Like Byron, Mickiewicz "woke up to find himself famous." The poems in these two volumes, though of varying degrees of merit, at once gave their author a reputation superior to that of any native poet. Many of them are founded on old Lithuanian superstitions and folk-songs. Two longer poems are contained in this collection: one of them, *Grazzna*, tells how a Lithuanian princess, for her husband's honor, dies, in his armor, upon the field. The other, *Dziady*, or *The Ancestors*, is a sort of autobiographical drama of marked power. Dmochowski, the translator of Homer, attacked him for his romanticism; but a new school of rising poets gathered round him, and became known as the "School of Mickiewicz." His popularity with his countrymen was raised to an unbounded pitch by his imprisonment by the Russian authorities on account of his connection with the Polish secret societies. His friend Zan was sentenced to perpetual imprisonment; and Mickiewicz was condemned to perpetual banishment in Russia. He resided at first in St. Petersburg, where he made the acquaintance of Pushkin and other literary men. His intimacy with Pushkin excited the suspicions of the Russian government, which forced him to remove to Odessa. He traveled through the Crimea, and records his impressions in the *Crimean Sonnets*. These sonnets became very popular, perhaps as being the first written in Polish; but they are inferior to most of his other work. He lived for a time in the household of prince Galitzin, the governor of Moscow; but was soon allowed to remove to St. Petersburg. There, in 1828, he published *Conrad Wallenrod*, which, though having a distinct political animus, escaped the Russian censorship. It relates the story of a Lithuanian, who rose, in the 14th c., to the mastership of the order of Teutonic knights, enemies of Lithuania, solely to have a better opportunity to destroy them. The intention of the poem was clear to the Poles, but was lost upon the Russians. The work was translated into Russian, and the emperor Nicholas complimented its author. It is said that he was even offered a post in the Russian service, but he declined, and requested to be given permission to visit Italy for his health. His request was granted, through the good offices of the Russian poet Zhukovsky, and he started for Italy, by way of Germany, where he met Goethe. He took up his residence in Rome, where he became an intimate friend of James Fenimore Cooper. At Rome he heard of the Polish uprising of 1830, which the insurgents at Warsaw began by singing some parts of his *Ode to Youth*. He had gone as far as Posen, on his way to participate in the insurrection, when the news came that it was quelled. He went to Dresden, where he wrote a second part of *Dziady*, which appeared at Paris in 1832. This second part is likewise autobiographical, and gives an account of the poet's imprisonment at Wilna. He here represents himself in a scene which has been pronounced worthy of Goethe, as possessed by the devil, who is driven out from him by a priest. His last work of any length was a poem called *Pan Tadeusz*, or *Sir Thaddeus*, which appeared in 1834. It is entirely different in character and construction from the poet's other works. It deals with Lithuanian domestic life at the time of the approach of Napoleon's army in the campaign of 1812. Two years before the publication of *Pan Tadeusz* he wrote an absurd and eccentric work called *A Book of the Polish Nation and the Polish Pilgrimage*. In this book he attributes all the calamities which have fallen upon Poland to its toleration of Protestantism. Count Montalembert translated the book into French, on account of the warmth of its Roman Catholicism. He was married at Paris, in 1834, to a Polish lady named Celina Szymanowska, to whom some of his earlier verses are addressed. In 1839 he became professor of classical literature at Lausanne, and the next year he was called to the newly established chair of the Slavonic languages and literature in the college of France. His first lectures were successful; but he soon began to display a peculiar fanaticism. A Polish impostor, named Towianski, who had cured Mme. Mickiewicz by mesmerism in 1841 pretended to have revelations from the Virgin Mary, and these were interpreted by Mickiewicz. The latter finally ceased to allude to Slavonic literature at all in his lectures, but extolled Towianski as the new Messiah, and preached the worship of Napoleon Bonaparte. In 1844 the French government put a stop to the lectures, and ordered Towianski out of Paris. Mickiewicz's name, however, was not expunged from the list of professors. In 1848, after the February revolution, he went to Italy, in the vain hope of inducing the pope to do something in behalf of Poland. At the beginning of the

Crimean war he presented the cause of Poland to Louis Napoleon, who sent him on a mission to the east in 1855; and he died at Constantinople. The best edition of his works was published at Paris in 1844, edited, under his own supervision, by Alexander Chodzke. *The Polish Pilgrimage* was translated into English by Lach Szyrma, and the *Wallenrod* by Leon Jablonski. A poetical version of the latter work, by Cattley, appeared at London in 1840. Mickiewicz stands at the head of the literature of his own country, and his position in the general literature of Europe is high. No poet of this century, except Byron, to whom he has often been compared, has left more original poetical work of undoubted intellectual power and imagination; but the prose writings of Mickiewicz are, for the most part, extravagant and feeble.

MICKLE, WILLIAM JULIUS, 1734–88, b. Scotland; son of a Presbyterian clergyman, who had been assistant to Dr. Watts, and had been one of the translators of Bayle's *Dictionary*. After his father's death Mickle entered the business of his uncle, an Edinburgh brewer, who finally admitted him as a partner. He had, however, little business aptitude, and in 1755 he went up to London to get a commission in the navy. His efforts in this direction were unsuccessful, but he made the acquaintance in London of the first lord Lyttelton, who advised him to continue those poetical studies to which he had already given much of his time. He secured employment for a time as a corrector for the Clarendon press in Oxford. This was about 1765, and between that year and 1770 he published a number of minor pieces, one of which, an elegiac ode called *Pollio*, attracted considerable attention. *Concubine*, a poem in the Spenserian manner, appeared in 1767, and again, with many alterations and additions, as *Sir Martyr*, some ten years later. In his *Letter to Dr. Harwood*, and his *Voltaire in the Shades*, he attacked Arianism and deism; and about the same time he wrote a tragedy called *The Siege of Marseilles*, which was refused by all the managers, and was not represented. He had long projected an English version of the *Lusiad* of Camoëns; and his translation of the first book of that work appeared in 1771. He now left Oxford, though still maintaining himself by his work as a corrector there, and removed to the country, where he continued his translation of Camoëns, which was completed in 1775. This translation, though severely criticised in England on account of its diffuseness and inexactness, secured for Mickle the honor of an election to the royal academy of Portugal, during his residence in that country, where he had gone in 1779 as secretary to gov. Johnstone, and prize-agent. He published, while in Portugal, a poem called *Almada Hill*. On his return to England he wrote a number of pieces in verse and prose; the last of his productions was a ballad called *Eskdale Braes*.

MICMACS, the name of a tribe of Indians belonging to the Algonquin family, and inhabiting the maritime provinces of the Dominion of Canada—New Brunswick, Nova Scotia, Cape Breton, and Prince Edward island—and Newfoundland. They were found by the Cabots in their voyage in 1497, and some of them were taken to England as specimens of the North American Indian race. They preferred the sea-coast, and were expert hunters and fishermen. At the time of the French settlement of Canada there were believed to be between 3,000 and 4,000 Micmacs in the lower provinces; and missionaries worked among them with good results, particularly in gaining their permanent friendship for the French people. They fought and plundered the English persistently until 1760, after which date treaties were made with them, and reservations were set aside for them in New Brunswick. Efforts were made to direct their attention to agricultural pursuits, but these were unavailing. This tribe was peculiar in possessing a system of hieroglyphics of considerably more scope than existed among any other of the northern tribes. In 1873 there were 3,600 Micmacs, of whom 2,165 were in Nova Scotia and Cape Breton, 1,386 in New Brunswick, and 70 in Newfoundland.

MI'CROCOSM AND MACROCOSM. The belief, current in ancient times, that the world or cosmos was animated, or had a soul (see ANIMA MUNDI), led to the notion that the parts and members of organic beings must have their counterparts in the members of the cosmos. Thus, in a hymn ascribed to Orpheus, the sun and moon are looked upon as the eyes of the animating godhead, the earth and its mountains as his body, the ether as his intellect, the sky as his wings. The natural philosophers of the 16th c.—Paracelsus at their head—took up this notion anew in a somewhat modified shape, and considered the world as a human organism on the large scale, and man as a world, or cosmos, in miniature; hence they called man a *microcosm* (Gr. little world), and the universe itself the *macrocosm* (great world). With this was associated the belief that the vital movements of the microcosm exactly corresponded to those of the macrocosm, and represented them, as it were, in copy; and this led naturally to the further assumption that the movements of the stars must exercise an influence on the temperament and fortunes of men. See ASTROLOGY.

MICROCOS'MIC SALT is a tribasic phosphate of soda, oxide of ammonium, and water, which crystallizes with 8 equivalents of water, its formula being NaO,H_4NO,HO,PO_5+8Aq. It is prepared by mixing a hot solution of 6 parts of phosphate of soda with a concentrated solution of 1 part of muriate of ammonia, when the microcosmic salt crystallizes in large transparent prisms, while common salt remains in solution. On the application of heat it first loses its water of crystallization, and then its oxide of ammonium and basic water, so that only metaphosphate of soda remains, which, from its

ready fusibility into a colorless glass, is valuable as a flux in blow-pipe experiments. See BLOW-PIPE. This salt occurs in decomposed urine.

MICROM'ETER (Gr. *mikros*, little; *metron*, measure) is an instrument used for the measurement of minute distances and angles. Its different forms, depending on different principles, may be divided into two sections, according as they are applied to physics or astronomy. Of the former section are the vernier (q.v.) and the micrometer screw, the latter instrument being merely a screw with a very regular thread, and a large round head, which is carefully graduated, generally to sixtieths, and furnished with an index. It is easily seen that if a complete turn of the screw advance its point $\frac{1}{60}$th of an inch, a turn sufficient to pass the index from one graduation to another will only advance it $\frac{1}{3600}$th of an inch, etc. This is the micrometer used in the construction and graduation of instruments. Of those applied to astronomical purposes, the most simple is a short tube, across the opening of which are stretched two parallel threads, which are moved to or from each other by screws. These threads are crossed by a third perpendicularly, and the whole apparatus is placed in the focus of a lens. The distance of two stars is found by adjusting the two parallel threads, one to pass through the center of each star, taking care that the threads are placed perpendicular to the line joining the stars, and finding how many turns and parts of a turn of the screw are required to bring the wires to coincide. The angle of position of two stars is also obtained by turning round the instrument till the third wire, which is normally horizontal, bisects both stars; and reading off on the circumference the arc passed over. *Fraunhofer's suspended annular micrometer* consists merely of a steel ring surrounded by a flat rim of glass, and the position of the star is deduced from the time when it crosses the ring, and its path while within it. The abbé Rochon substituted for the wire micrometer one made of two prisms of rock-crystal or Iceland spar, capable of double refraction.

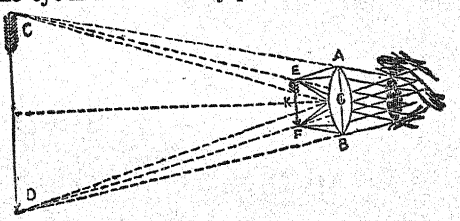
MICRONESIA AND MELANESIA, names of Greek origin, meaning respectively "small islands" and "black islands." The first is used by most geographers to describe the Ladrone and Caroline islands, Marshall's islands, the Kingsmill group, Radack and Ralick chains, the Gilbert group, and many others of small size. All of these are in the n.w. part of Polynesia and e. of India, being all n. of the equator and between 130° and 180° e. long. The most important of the groups are described under the proper titles. The inhabitants of the various groups speak a tongue which is not similar to those used in other parts of Polynesia, but nearer akin to that of the Malays, to whom many of the islanders bear a strong resemblance in color and features. Like most of the Polynesian groups, the islands are of coral or volcanic formation, scarcely rising above the level of the sea. Very little political or social connection exists between the different groups. The civilization and language of Micronesia were evidently derived in ancient times from contact with or descent from the Malays. The language is clear, flowing, and indicates that the inhabitants have at some time in the past been in a much higher state of civilization than when first visited by Europeans. Missionary stations have been established upon many of the islands and large numbers of the natives have been Christianized. On the other hand, the custom of ships, and especially whalers, of using the islands as a watering-station, has introduced drunkenness, debauchery, and disease to such an extent that the population is rapidly decreasing. The natives are distinguished from those of Australasia by their brown complexions and straight hair. In Melanesia, as the name implies, the inhabitants have the characteristics of the negro race. This name is given by some modern writers on geography to that part of Australasia lying s. of the equator and of Micronesia, and including Papua or New Guinea, New Ireland, Solomon's isles, the Louisiade group, New Hebrides, New Caledonia, and many small groups. The name is given altogether on the physiological grounds indicated, and is hardly well established as a geographical designation. See, for description, the articles under the names of the separate islands; also POLYNESIA, *ante*.

MI'CROPHONE. This instrument, invented in 1878 by prof. Hughes, does for faint sounds what the microscope (q.v.) does for matter too small for sight; the fall of a bit of tissue-paper or the tread of a fly being rendered audible at many miles distance. In principle the microphone illustrates the action of sonorous vibrations on the strength of an electric current. One of the most sensitive substances for microphonic action is willow-charcoal, plunged in a state of white heat into mercury. The theory is that in a homogeneous conductor the compressions and dilatations of the molecules balance each other, and no variation of current ensues, while under minute subdivision, with electrical continuity, sonorous waves affect the strength of an electric current, and variations in the current reproduce sonorous waves. One form of microphone consists of a piece of mercury-tempered carbon an inch long, placed vertically between two carbon-blocks hollowed to receive its ends, wires connecting the blocks with the battery and the receiver by which the sounds are to be heard. "A piece of willow-charcoal," says the inventor, "the size of a pin's head is sufficient to reproduce articulate speech." Two nails laid parallel, with wire connections, and a third nail laid across them, make a simple form of microphone. A few cells of any form of battery may be used. A continuous sound has been made by the mutual interaction of the microphone and telephone (q.v.), each instrument in turn repeating the sound made by the other. Many useful applications of the microphone have been made or suggested.

MI'CROSCOPE (Gr. *mikros*, small, and *skopeo*, I see) is an instrument for enabling us to examine objects which are so small as to be almost or quite undiscernible by the unaided eye. Its early history is obscure; but as it is quite evident the property of magnifying possessed by the lens must have been noticed as soon as it was made, we are quite safe in attributing its existence in its simplest form to a period considerably anterior to the time of Christ. It is generally believed that the first compound microscope was made by Zacharias Jansen, a Dutchman, in the year 1590, and was exhibited to James I. in London by his astronomer, Cornelius Drebbel, in 1619. It was then a very imperfect instrument, coloring and distorting all objects. For many years it was more a toy than a useful instrument, and it was not until the invention of the achromatic lens by Hall and Dollond, and its application to the microscope by Lister and others, that it reached the advanced position it now occupies among scientific instruments.

An object to be magnified requires simply that it be brought nearer to the eye than when first examined, but as the focal distance of the eye ranges from 6 in. to 14 in.—10 in. being the average focal distance—it follows that a limit to the magnifying power of the eye is attained whenever the object to be examined is brought so near. If, however, we blacken a card, and pierce a hole in it with a fine needle, and then examine a minute object, as, for instance the wing of an insect held about an inch from the card, we shall see it distinctly, and that too magnified about ten times its size. This is explained by the fact that the pin-hole limits the divergence of the pencil of rays, so that the eye can converge it sufficiently on the retina to produce a distinct impression, which is faint; and did not the blackened card exclude all other light, it would be lost. If we now remove the blackened card without either removing our eye or the object under examination, it will be found that the insect's wing is almost invisible, the unassisted eye being unable to see clearly an object so near as one inch; thus demonstrating the blackened card with the needle-hole in it to be as decided a magnifying instrument as any set of lenses.

By the apparent size of an object is understood the angle formed by two lines drawn from the center of the eye to the extremities of the object, which is larger when the object is nearer the eye than when further removed. This angle is called the angle of vision, and is quite distinct from the angle of the pencil of light, by which the object is seen. The focal length of a lens determines its magnifying power. The object to be examined is placed in its focus, so that the light which diverges from each point may, after refraction by the lens, proceed to the eye in lines as nearly parallel as is necessary for distinct vision. Thus, in fig. 1, AB is a double convex lens, in the focus of which we have drawn an arrow, EF, to represent the object under inspection. The cones drawn from its extremities are portions of the rays of light diverging from these points, and falling on the lens. These rays, if not interrupted in their course by the lens AB, would be too divergent to permit their being brought to a focus upon the retina by the lenses which constitute the eye.



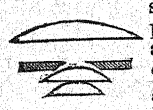


Fig. 1.

But as they are first passed through the lens AB, they are bent into nearly parallel lines, or into lines diverging from some points within the limits of distinct vision, as from CD. Thus bent, these rays are received by the eye as if proceeding from the larger arrow CD, which we may suppose to be 10 in. from the eye, and then the ratio of the length of the virtual image to that of the real arrow (nearly 10 to 1) gives the magnifying power of the lens in question. The ratio of CD to EF is the same as that of HG to KG. Now, HG is the distance of distinct vision, and KG the focal length of the lens, so that the magnifying power of a lens is obtained by dividing the distance of distinct vision (10 in. for most individuals) by its focal length. Thus, if the focal length of a lens be $\frac{1}{4}$ in., the magnifying power is $\frac{10}{\frac{1}{4}} = 40$. This supposes that the distance between the eye and the lens is so small as not materially to interfere with the correctness of this statement.

We have supposed the whole of the light to enter the eye through the lens AB (fig. 1), but we must now state that so large a pencil of light passing through a single lens would be so distorted by its spherical figure, and by the chromatic dispersion of the glass, as to produce a very indistinct and imperfect image. This is so far rectified by applying a stop to the lens, so as to allow only the central portion of the pencil to pass. But while such a limited pencil would represent correctly the form and color of the object, so small a pencil of light is unable to bear diffusion over the magnified picture, and is therefore incapable of displaying those organic markings on animals or plants which are often of so much importance in distinguishing one class of objects from another. Dr. Wollaston was the first to overcome this difficulty, which he achieved by constructing a doublet (fig. 2) which consists of two plano-convex lenses, having their focal lengths in the proportion of 1 to 3, and placed at a distance best ascertained by experiment. Their plane sides are placed towards the object, and the lens of shortest focal length next the

Fig. 2.

object. By this arrangement the distortion caused by the first lens is corrected by the second, and a well-defined and illuminated image is seen. Dr. Wollaston's doublet was further improved by Mr. Holland, who substituted two lenses for the first in Dr. Wollaston's doublet, and retained the stop between them and the third. This combination, though generally called a triplet, is virtually a doublet, inasmuch as the two lenses only accomplish what the anterior lens did in Dr. Wollaston's doublet, although with less precision. In this combination (fig. 3) of lenses, the errors are still further reduced by the close approximation of the lenses to the object, which causes the refractions to take place near the axis, and thus we have a still larger pencil of light transmitted, and have also a more distinct and vivid image presented to the eye.

Fig. 3.

Simple Microscope.—By this term we mean an instrument by means of which we view the object through the lens directly. These instruments may be divided into two classes—those simply used in the hand, and those provided with a stand or frame, so arranged as to be capable of being adjusted by means of a screw to its exact focal distance, and of being moved over different parts of the object. The single lenses used may be either a double convex or a plano-convex. When a higher power is wanted, a doublet, such as we have already described, may be employed, or a Coddington lens which consists (fig. 4) of a sphere in which a groove is cut and filled up with opaque matter. This is perhaps the most convenient hand lens, as it matters little, from its spherical form, in what position it is held. In the simple microscope, single or combined lenses may be employed, varying from ¼ to 2 inches. There are many different kinds of stands for simple microscopes made, but as they are principally used for dissection, the most important point next to good glasses is to secure a firm large stage for supporting the objects under examination. When low powers alone are used, the stage-movements may be dispensed with; but when the doublet or triplet is employed, some more delicate adjustment than that of the hand is necessary.

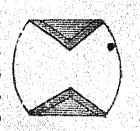

Fig. 4.

Compound Microscope.—In the compound microscope the observer does not view the object directly, but an inverted image or picture of the object is formed by one lens or set of lenses, and that image is seen through another lens. The compound microscope consists of two lenses, an object and an eye lens; but each of these may be compounded of several lenses playing the part of one, as in the simple microscope. The eye-lens is that placed next the eye, and the object-lens that next the object. The former is also called the ocular, and the latter the objective. The object-glass is generally made of two or three achromatic lenses, while the eye-piece generally consists of two plano-convex lenses, with their flat faces next the eye, and separated at half the sums of their focal lengths, with a diaphragm or stop between them. Lenses of high power are so small as to admit only a very small beam of light, and consequently what is gained in magnifying power is often worthless from deficient illumination. Various devices have been employed to overcome this difficulty. The light may be concentrated by achromatic condensers placed beneath the stage, or the curvature of the lens may be such as to allow as large a number of divergent rays as possible to impinge upon it. Such a lens is said to have a large "angle of aperture," the angle of aperture being that made by two lines converging from the margins of the lens to its focal point. Recently lenses, termed "immersion lenses," have been constructed, of such a curvature that when immersed in a drop of water placed over the object, light is admitted on all sides. With an immersion lens, there is high magnifying power with sufficient illumination.

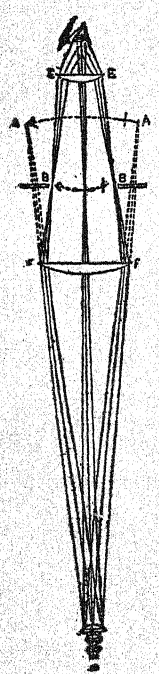

Fig. 5.

The following diagram (fig. 5) explains the manner in which the compound microscope acts. We have here represented the triple achromatic objective, consisting of three achromatic lenses combined in one tube, in connection with the eye-piece, which consists of the field-glass FF, and the eye-glass EE. Three rays of light are represented as proceeding from the center, and three from each end of the object. These rays would, if not interfered with, form an image at AA; but coming in contact with the field-glass FF, they are bent, and made to converge at BB, where the image is formed, at which place a stop or diaphragm is placed to intercept all light, except what is required to form a distinct image. From BB, the rays proceed to the eye-glass exactly as they do in the simple microscope, and as we have explained in fig. 1. The image therefore formed at BB is viewed as an original object by an observer through the eye-piece EE. The lens FF is not essential to a compound microscope; but as it is quite evident that the rays proceeding to AA would fall without the eye-lens EE, if it was removed, and only a part of the object would thus be brought under view, it is always made use of in the compound microscope.

A mirror is placed under the stage for reflecting the light through the object under

observation. This method of illumination by transmitted light is used when the object is transparent. When opaque, light is reflected on the object by a bull's-eye lens, called a condenser. The best instruments are supplied with six or seven object-glasses, varying in magnifying power from 20 to 2,500 diameters. The eye-pieces supplied are three in number, each of which consists of two plano-convex lenses, between which a stop or diaphragm is placed, half-way between the two lenses. As the magnifying power of a compound microscope depends on the product of the magnifying powers of the object-glass and the eye-piece, it follows that its power may be increased or diminished by a change in either or both of these glasses. In the mechanical arrangements, it is of importance to have the instrument so constructed, that while every facility is afforded for making observations and easy means of adjustment, there should also be great steadiness, without which, indeed, no satisfactory results will be obtained. These ends are achieved in various ways, of which Fig. 6 is one of the simplest: *a*, brass stand, supported on three feet; *b*, mirror, supported on trunnions; *c*, diaphragm, pierced with circular holes of various sizes, to regulate the admission to the object of reflected light from the mirror; *d*, stage-plate, on which the object is placed; *e*, screw, with milled head for fine adjustment; *f*, the object-glass, or objective; *g*, brass tube in which the body of the instrument is moved, so as to effect the coarse adjustment; *h*, the eye-piece, or ocular.

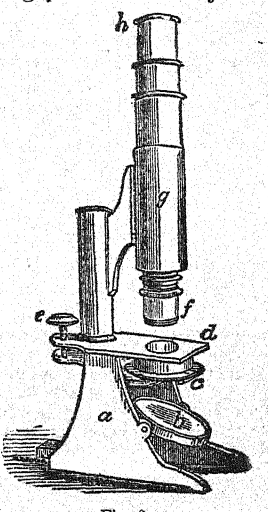

Fig. 6.

The microscope has now become so important an instrument in education, that almost every department of science in which it can be employed has a microscope suited to its particular kind of work, and a special treatise explaining and illustrating its use; and many branches of science have instruments peculiarly their own. Thus, chemists, anatomists, zoologists, etc., have each an instrument which they value as being peculiarly adapted for their special fields of inquiry and observation. From this instrument the chemist, and natural philosophers generally, have derived great assistance in studying the different kinds of crystals; for, by means of it, they can not only observe and recognize the great variety of forms that exist, but at any moment, and with little trouble, they may witness the process of crystallization, and leisurely study it. Those sciences in which it is most used, and for which it has done most, are anatomy, physiology, botany, zoology, medicine, mineralogy, and geology. In the practice of medicine all medical men who aim at a scientific treatment of disease have fully recognized how useful it has been as an agent in diagnosis, more especially in diseases of the kidneys. In the detection of crime and the vindication of innocence it is no less useful, as by means of it we can with certainty determine whether a suspicious stain, found, for instance, on the clothing of an individual charged with murder has been caused by blood or by another coloring-matter. In like manner we can determine whether hair found in similar circumstances belongs to a human being or not. It has also enabled us to distinguish the difference existing between substances that have a similar chemical reaction (e.g., the various kinds of starch, as flour, potato, sago, etc.), and thus we are provided with an agent quick in detecting adulteration.

A few hints to amateur observers may not be out of place here. In choosing an instrument, the simpler it is the better. The essential point to attend to is to have good glasses, which are tested by their power of showing some very minute markings, such as we find on diatoms. The circumference of the field of view should not be tinged with color, and the definition should be as good at the edge as at the center. The beginner should use low powers in preference to high ones. The best light is that reflected from a white cloud during the day. Artificial light should, if possible, be avoided. The table must be steady on which the microscope is placed, and when not in use the instrument should be covered by means of a glass shade. The observer also requires a few oblong glass slides, and a few circles of thin glass, called covering-glasses, to lay over the preparation under examination. For making sections, dissecting, and the various manipulatory operations attending the use of the microscope, he requires, moreover, a pair of forceps, a knife, or, perhaps better, a razor ground flat on the one side, a few needles fixed in handles, and two or three hair-pencils. So equipped, the observer is able to begin examinations of texture at once with pleasure and advantage. Begin with simple objects, such as pollen and thin slices of the cuticle of flowers, mosses, and different kinds of starch, such as *tous le mois*, buck yam, cycas, arrow-root, etc., and notice particularly their different characters. Make as thin a section as possible, place it on the center of the slide, and allow a drop of water to fall on it from the end of the handle of the needle. Then allow the covering-glass to fall gently on it—obliquely, so as to press out any small bubbles of air. He should also have a few bottles containing "reagents," such as dilute acetic acid (equal parts of pyroligneous acid and water) and liquor potassæ. By means of these reagents, peculiarities of structure may often be observed.

Microscopes vary much in price, from 5s. to upwards of £100. A good serviceable dissecting simple microscope may be had from any philosophical-instrument maker for from 9s. to 15s. Compound microscopes are more expensive, but a wonderfully good instrument for beginners can be had at 30s. It has one eye-glass and three object-glasses, and magnifies from 70 to 200 diameters. If a superior instrument is wished—one suited for most purposes of observation and research—any one of the following will be found well worth the price. The microscope of Hartnack, with a joint, so that it may be inclined at any angle, has two eye-pieces, two object-glasses, magnifies from 50 to 450 diameters, and costs about £7; Nachet's microscope has three eye-pieces, three object-glasses, magnifies from 50 to 750 diameters, and costs £10; Smith and Beck's educational microscope has two eye-pieces, two object-glasses, magnifies from 50 to 350 diameters, and costs £10; Ross supplies microscopes from £5 to £100, with various number of glasses.

For a more complete account of the different kinds of microscopes, and the various purposes to which they are applied, see Quekett *On the Microscope* (1855); Carpenter *On the Microscope* (1862); Hogg *On the Microscope* (1855); and *How to work with the Microscope* (1864), by Beale.

MICROSCOPIC ANIMALS. See ANIMALCULE, *ante*.

MICROTASIMETER, an instrument invented by Mr. Thomas A. Edison for the purpose of measuring very minute variations of pressure caused by the expansion or contraction of any given body, from whatever causes, heat, moisture, etc. A part of the apparatus is constructed upon the principle of the pyrometer, and when the expansion is caused by moisture, upon that of some forms of hygrometer. But the novel and unique part of the invention consists in the effect which the pressure of the expanding rod has upon the electric resistance of a piece of carbon placed in the circuit of a galvanic battery. A rod of vulcanite is used as the expanding element when it is desired to use the instrument to ascertain slight variations in the heat vibrations coming from any object, as the sun, or a gas, or electric light. This rod is adjusted in a strong frame kept at an equable temperature, so that no expansions or contractions shall exert any influence, except those which take place in the vulcanite rod itself. In the chamber which receives one end of this rod, or plate, there is placed under a follower, or slide, a piece of carbon, which becomes compressed with great force upon the expansion of the vulcanite rod. If radiant heat is to be measured, a large funnel is placed in front of the apparatus to gather the rays and throw them upon the rod or plate. When the rays increase in intensity the rod expands, compresses the button, and changes its conducting capacity, which at every moment is indicated by a galvanometer. The instrument has been used successfully to ascertain the variations in the radiation from the sun during an eclipse. It may also be used to note the variations taking place on a day when clouds are passing across the sun's disk, or when the transmission of his rays differs from increase or decrease of moisture. It may be used as a delicate hygrometer by substituting in place of the vulcanite rod a body containing gelatine, which expands under the influence of moisture.

MICROZA'MIA, a genus of plants of the natural order *cycadaceæ*. They are widely diffused over Australia. The fronds resemble those of palms, and are used in the Roman Catholic church on Palm Sunday. The underground stem is large and turnip-like, but covered with scales or leaf-scars, and contains a substance resembling tragacanth. The nuts of *M. spiralis* are edible, but are only used in times of scarcity.

MIDAS, a genus of platyrhine monkeys belonging to the family hapalidæ, which also contains the marmosets. The common name for the different species is *tamarin*. It has the following characters: Muzzle short, facial angle 60°; forehead with an appearance of prominence, arising from the great angle of the upper edge of the orbits; upper incisors contiguous, under incisors of the same size as upper; nails like claws, excepting those of the thumbs behind; tail the same as in the marmoset, or jacchus of Geoffroy, and dental formula the same, except that in the latter the incisors are more irregular. There are seven species, the typical one being *midas rosalia*, the marakina or silky tamarin. This very beautiful little monkey is of a golden yellow color, varying to a redder tint, rather paler on the back and thighs. The long and silky hair about the head and neck forms a kind of mane, on account of which it has sometimes been called the lion-monkey. Its beauty and gentleness render it a great pet; but it is delicate, and requires to be kept warm and dry. It is squirrel-like in its habits, a native of Guayana and the south of Brazil, from Rio Janeiro to cape Frio. There is a black and red variety, and one of a bright, shining red. The species should not be confounded with *M. leonina* of Humboldt, which is probably the smallest monkey known. It is brownish, and has a well-developed mane of that color which bristles up when the animal is angry so as to look like a little lion. It has a black face, a white mouth, and a tail black above and white below. It inhabits the plains bordering on the eastern slope of the Cordilleras, and is rare.

MI'DAS, a common name of the more ancient Phrygian kings, of whom Midas, the son of Gordius and Cybele, is the most famous. He was a pupil of Orpheus. Among the many legends regarding him is one that Bacchus granted his wish that whatever

he touched might become gold; from which so great inconvenience ensued, that he was glad to get himself relieved from the burden by washing, at the command of the god, in the Pactolus, the sands of which became thenceforth productive of gold. Another legend represents him as having offended Apollo by assigning the prize in a musical competition to Pan, and as having therefore been endowed by him with a pair of ass's ears, which he concealed under his Phrygian cap, but which were discovered by his servant.

MIDDELBURG, a t. of the Netherlands, capital of the province of Zeeland, in the island of Walcheren. It is connected with the sea by a canal, 5 m. long, which admits ships of heavy burden, and is a station of the railway from Flushing to Roosendaal to join the Dutch and Belgian lines. Pop. Jan. 1, 1875, 15,926. The city is nearly circular, and a league in circumference, surrounded by a broad canal. In former times Middelburg was one of the leading mercantile cities of the United Provinces, sending many ships to the East and West Indies, America, and all European ports, founding the colonies of Surinam, Berbice, Essequibo, Demerara, etc.; but the opening of the Scheldt for Antwerp, and other causes, have reduced the foreign trade to single ships to Java. Many of the inhabitants are wealthy, which, with its being the meeting-place of the provincial states of Zeeland, and possessing a considerable trade in grain, salt, etc.—making beer, vinegar, starch, leather, having snuff, chocolate, oil, and saw mills, and foundries—make it still a city of importance. It is the finest city of the northern provinces, having handsome houses, ornamented with gardens, and the canals and streets shaded with trees. The town-house, founded in 1468, has a beautiful tower, and is decorated with 25 colossal statues of counts and countesses of Holland. At the beginning of the 12th c. an abbey was founded, which was later enriched by Willem II., count of Holland and Zeeland. The buildings are now occupied as the meeting-place of the provincial states.

Middelburg does not date further back than the 9th century. In 1574 the Spaniards, under Mondragon, were compelled by famine to give up Middelburg, after having defended it for 22 months against prince Willem I. Though troops are stationed in Middelburg, it is no longer tenable against an enemy.

MIDDLE AGES, the designation applied to the great historic period between the times of classic antiquity and modern times. The beginning and close of this period are not very definite. It is usual, however, to regard the middle ages as beginning with the overthrow of the western Roman empire in the year 476; and there is a pretty general concurrence in fixing on the reformation as the great event which brought this period to a close. It began with the rise of the Frankish upon the ruins of the ancient Roman empire, and with the commencement of civilization among the barbarous tribes which had taken possession of the former Roman provinces. In course of it the different nations of modern Europe were formed, and their political and social systems developed. It was a period of much superstition, in connection with which much religious enthusiasm very extensively prevailed, manifested in many great religious endowments, in magnificent ecclesiastical buildings, in pilgrimages, and, above all, in the crusades. In the earlier parts of this period the church was much occupied in the extension of its bounds in the north of Europe, where heathenism still subsisted, and the means employed were not always consistent with the spirit of Christianity. During the middle ages the hierarchy acquired enormous power and wealth, and the papacy rose from comparatively small beginnings to its utmost greatness. During the middle ages chivalry had its rise and decline, modifying and in many respects tending to refine the feelings and usages of society. Towards the close of the middle ages the revival of letters, the increase of knowledge, and the formation of a wealthy and influential class in society, distinct alike from the aristocracy and the peasantry, tended, even before the reformation, both to the diminution of the power of the hierarchy and the decay of the feudal system. See Guizot's *Histoire de la Civilisation;* Rühs's *Handbuch der Geschichte des Mittelalters;* and Hallam's *History of the Middle Ages.*

MIDDLE AGES (*ante*), the period in history from the 5th to the 15th c., or between the fall of the Roman empire and the reformation. Its beginning witnessed the successful invasion of southern Europe by the barbarians of the north. The Vandals were masters of Africa; Spain was divided between the Suevi and the Visigoths, the latter occupying also a large portion of Gaul; Italy was in the hands of the Ostrogoths; while a tribe of Germans under Clovis had invaded and conquered France. The comparatively new Byzantine or eastern empire had already begun to decline, through the weakness and licentiousness of its rulers. Paganism had been overthrown, and Christianity was gradually penetrating into the unknown wilderness of northern and central Europe. What were known as the "dark ages," the first centuries of this period, had commenced the destruction of the old civilization which had been propagated from Phenicia, and had culminated in the ascendency of Greece and Rome. Western Europe, including even Italy, "lay prostrate at the feet of barbarian conquerors, and was a howling waste, in which the law of the strongest only prevailed."—The middle ages closed with the advent of Luther, Melanchthon, and Calvin, and the great battle for the freedom of the human conscience; with the discovery of America by Columbus; and with the invention of the art of printing by Guttenberg, Faust, and Schöffer, and

its application to the printing of the Bible at Mayence. In the beginning of this period the countries which we have named were swayed by incidental leaders and potentates, and given up a prey to a soldiery who lived by depredation and rapine. Protection for life or property there was none; and even the savage chieftains of that ignorant age soon perceived the necessity for some authoritative restraint. Out of this necessity grew the feudal system, in France, Germany, Aragon, a large part of Italy, England, and Scotland, probably occasioned in part by the gradual destruction of slavery, and in part to the fall of the Roman empire, for so long a time the seat of government of the world. It was natural that with Rome fallen, Europe should become divided among petty barons and princes, whose authority could only subsist so long as they were enabled to sustain it by force of arms. Under these circumstances, each leader fortified his possessions; and it was then that many of the castles and fortresses were erected, whose ruins are to-day the admiration of tourists in Europe. Every man who was capable of bearing arms was a soldier; and there was no such thing as a laboring class, since the hinds and villains who did the drudgery under the feudal system were held to be but little above the brutes whose care was one of their chief duties. Of this period it has been concisely said, "the peculiar general character of feudalism is the dismemberment of the people and of power into a number of petty nations and petty sovereigns; the absence of any central government." The foundation of this system consisted in the allotment of land in fee (Latin *feudum*), with the powers of bequest and inheritance, to the petty chieftains, who on their part agreed to give their services and those of their vassals, whenever called upon, either to repel invasion or to make incursions into the territory of others. Later, these barons, counts, and others, were permitted to take surnames, usually from the names of their castles or villages, and to adopt armorial bearings. This whole movement was a slow formation of the royal and noble elements of society as organized in future centuries.

With feudalism intervened another element of specific influence—the introduction of monasticism and the monastic orders throughout Europe; for the foundation of monasteries in Europe proves to have been a necessity to the progress of civilization. They served as a nucleus around which settlements were formed, the settlements growing into towns, the towns into cities. The prelates and abbots were feudal nobles, equally with the barons and counts. Their tenure of land was the same; and though they were not absolutely required to perform military service, there were many fighting men among them who did so, while none were exempt from furnishing their quota of armed vassals. And as the church grew strong in Rome, some reflection of her strength was felt wherever her servants were; until it was often the case that the lords and barons were made to experience a power in the hands of the abbots that they themselves did not possess. While the monastic system had undeniable and great evils, the teachings of the monks led generally toward a respectable, honest, and humane mode of life; and on such teachings the arts of peace and culture began to take root and flourish amid disorder and depredation, such as had not been known before since the foundation of Rome.

A new feature was after a time introduced into the feudal system by the occasional calling together of an assembly of the feudal lords by the sovereign—more, it is true, with the view of sustaining amicable relations with them than for any purpose of the division either of power or responsibility. At first these assemblies were merely festive gatherings; but after a time they assumed the form of advisory, and at last of deliberative meetings, when all legislative enactments were considered and debated. There were even in some of these gatherings traces of representative legislation; they were the first faint beginnings of the constitutional monarchy of a later age. The convocation of the French states-general, in 1302, was the first positive departure in this direction. The feudal system was now gradually discarded. The petty feuds of the early part of the middle ages became the great wars of their latter centuries, when the simple feudal compact could not supply such armies as were required. The tendency towards consolidation began now to be felt, just as that of displacement and separation had held sway after the fall of Rome. Kingdoms grew into enormous possessions and great wealth. Mercenary troops were employed in war, hired from monarchs or states not engaged in the conflict; and thus the idea of standing armies ready for emergencies grew into being. In fact, centralization of power began to be the law under which kings and emperors were conducting their policy, while representation was being made the lever with which the people were seeking to gain greater freedom of conscience and of person. This general condition spread through England and Scotland, France, Germany, Italy, and Spain. In Italy, Lombardy, and Venice arose republican governments; and the anomaly of great cities self-governed appears as one of the extraordinary features of the middle ages. Venice grew great in the arts and in commerce, and the marvelous promise of the period was broken only by intestine quarrels and the factious fights of the Guelphs and Ghibellines, and of other powerful Italian families, which, however, resulted in the destruction of the franchises of the people, and the foundation of petty principalities on the ruins of the liberty which had been achieved by the free cities. The history of Florence, Pisa, Genoa, and Venice, during a major part of the middle ages, is that of all Italy after the period when the northern portion of that country was under the control of the German emperors. Their commerce covered the Mediterranean, the Black sea, and the Adriatic, and extended into the far east by caravans. In the

darkest and most barbarous period, Venice conducted an extensive traffic both with the Greek and Saracen regions of the Levant. The crusades, which swept over Europe with an unexampled wave of enthusiasm, enriched and aggrandized Venice more perhaps than any other city. Her splendor, however, may be dated from the capture of Constantinople by the Latins in 1204, by an enterprise which, originally intended for the recovery of Jerusalem, was diverted to this more profitable adventure, in which not only the Venetian nations but the French were engaged. In the meantime wars assumed a scientific character, gunpowder was introduced into Europe, probably through the Saracens, and artillery began to be used in the early part of the 14th century. But incessant revolutions and family feuds tore the Italian republics to pieces, until Florence, the last of them, succumbed under the domination of Lorenzo de' Medici.

Charlemagne, king of the Franks and emperor of the Romans (768–814 A.D.), after his conquest of the Saxons and the Lombards, was invited into Spain to interpose in the wars of the Arabs and Moors in that country, and seized and added to his dominions all that territory lying between the Pyrenees and the Ebro. The Saracens conquered Spain in 711 A.D., and left behind them monuments whose ruins attest to this day the wonderful progress of oriental art under the caliphs, and give evidence of the spirit and enterprise which characterized the Arabs from the time of Mohammed to that of their expulsion from Spain (1492), when they had erected new empires in three-quarters of the globe.

The beginning of the 13th c. had seen an eruption of barbarians from Chinese Tartary, extending across all Asia and as far as the Euxine, which was not even paralleled by the invasion of Spain by the Saracens, or that of Italy by the savages of the north. Reducing the caliphate of Bagdad, they subverted the governments of Persia, Syria, and Iconium. To them it was owing that the Turks of the latter country, under Othman, penetrated through Asia Minor into Europe, from whence not all the western powers in six centuries have dislodged them.

The power of the church in the middle ages began in the conversion of Constantine, emperor of the west, who was baptized shortly before his death, 337 A.D. It was gained by slow steps, beginning with the accumulation of territory, and being extended by assumption of the authority to declare excommunication and interdict. By gaining vast wealth, and by playing upon the fears of weak princes, the bishops gradually encroached upon the rights and privileges of the highest potentates of Europe, until the pontifical authority of Rome controlled nearly every king and emperor from the Adriatic to the North sea. It was this influence that organized the crusades, and that occasioned half the wars that convulsed Europe during a period of ten centuries, yet without which, at this peculiar age of the world, civilization, the arts, letters, and commerce alike would have languished or remained unborn. The missionary enterprise of the church, after the discovery of America, populated the western continent, and opened an entire hemisphere to new empire and a new civilization. Devotion to the church prompted the genius of Raphael and Michael Angelo, and gave form to the wonderful conceptions which resulted in the spread of Gothic architecture, the most original, the most comprehensive, and the most symbolic that the world ever saw. It has already been shown how the ceaseless energy and enterprise of the church was the foundation of the advance from barbarism to civilization which characterized central and northern Europe between the 5th and the 12th century. At no other period in the world's history has there been such an awakening out of darkness and incapacity into light and power as that which followed the culmination of the strength of the church. Yet it was in the period immediately succeeding the reformation—the first and fiercest blow struck at the influence and prerogative of the church—that this awakening—*renaissance*—reached its height. When the middle ages closed, a Protestant queen was on the throne of England, then in the zenith of power and splendor. Calvin, Luther, and Melanchthon were defying the pope and making all Europe ring with tones deeper and further reaching than even those of the Vatican. The schools of art of Antwerp, Venice, Rome, and Siena had revived the genius of the Augustan age, and the newly-discovered power of the press was beginning that vast dispensation of intelligence which marks the modern period. Meanwhile, Cabot, Vespucius, and Vasco de Gama were sailing forth to discover new continents; Cortes and Pizarro were destroying the hitherto unknown Aztec civilization; and but a brief time elapsed before the pilgrim fathers planted the first seeds of freedom in America, leading in the new epoch of wars, conquest, legislation, disintegration, and rebuilding, which we call modern history.

MIDDLE BASE AND **MIDDLE CHIEF.** See POINTS OF ESCUTCHEON.

MIDDLE BASS ISLAND. See PUT-IN-BAY ISLANDS.

MIDDLEBOROUGH, a t. in s.e. Massachusetts, on the Namasket river, the junction of several lines of the Old Colony railroad—the Cape Cod branch, Boston to Provincetown, the Middleborough, Taunton and Providence, and the Old Colony and Newport. It is one of the most ancient towns in Plymouth co., and a summer resort of great attractiveness, on account of the picturesque beauty of its scenery and numerous features of historic interest within the town limits. Previous to the incorporation of the town of Lakeville, which was taken from its territory, it was the largest town in the state, and now numbers more than 60 sq.m.; pop. '80, 5,237. It lies on both sides

of the river, which runs in a winding course from large lakes (in the adjoining town) 5 m. away, with three falls furnishing valuable water-power, emptying into Taunton river. Game and fish abound in the lakes and their vicinity, and a small excursion steamer plies between the pic-nic grounds on the lakes to a pier at the upper falls. It comprises the thriving villages (all with churches, post-offices, and manufactures) of North Middleborough (Titicut), South Middleborough, The Rock, East Middleborough (Eddyville), a number of smaller villages and neighborhoods, and Middleborough Four Corners, the central portion, which is designated as Middleborough. It has several public halls, an elegant town house containing a commodious hall, a room for the district court, the public library, and a bank, besides the town offices, erected at a cost of $50,000, standing on an eminence commanding a view of many points of interest, among them Muttock Hill cemetery, about a mile from the Corners, a beautiful spot, where rest some of the founders of the old colony. In this vicinity is Oliver's walks, the site of the mansion of judge Oliver, who in the revolution espoused the tory cause and went to England. It was the seat of Peirce academy (Baptist), founded 1808, with a classical department, a valuable cabinet, and an average attendance of 300 pupils, including many from the southern states. During the rebellion its popularity diminished, and it has since been discontinued. The town has excellent public schools, is lighted by gas, and is laid out regularly, with numerous maples, elms, and other ornamental trees shading the streets and highways, which are celebrated for their beautiful drives. It contains the Bay State straw-works, employing a large number of girls in its extensive factories and at their homes in the adjoining towns and villages, 5 shoe-factories, 3 churches, 2 newspapers (1 monthly), 2 printing-offices, a hotel, the Star mills (woolen), and manufactories of lumber, shovels, needles, trunks, boxes, varnish, marble-works, and a variety of stores. It is a center of an important trade in horses, which are brought from Vermont and Canada. It is 12 m. from Plymouth, 10 m. from Taunton, 20 m. from New Bedford, 20 m. from Fall River, and 34 m. from Boston.

MIDDLEBURY, a t. in central Vermont, delightfully situated on Otter creek, a small stream flowing n.w. and emptying into lake Champlain; in a mountainous region, presenting very attractive scenery; pop. '80, 2,993. The Central Vermont railroad passes through it. It is 33 m. n.w. of Rutland, 35 m. s. of Burlington, and 33 m. s.w. of Montpelier. It has valuable water-power. It is the seat of Middlebury college, and has excellent public schools and a public library. It contains a national bank, 2 newspapers, 6 churches, 3 hotels, and a well-organized fire department. It has six quarries, where marble of various colors is quarried and exported, and it has iron-foundries and flour-mills; other industries are the manufacture of sashes, doors and blinds, cotton, wool, paper, and leather.

MIDDLEBURY COLLEGE, in Middlebury, Vt., opened in 1800, under Congregational control, has three buildings valued at $100,000, an interest-bearing endowment of $180,000, and an income of $13,000 annually. There are 11 instructors, and a library of 12,000 volumes. President (1881), Rev. Cyrus Hamlin, D.D., formerly a well-known missionary in Turkey.

MIDDLE C, in music, receives its name from its position on the general scale. It is the note which is a fifth above the F or bass clef, and a fifth below the G or treble clef. The C clef always represents the note termed middle C, and the lines and spaces above or below are designated accordingly.

MIDDLE LATITUDE SAILING. See SAILINGS.

MIDDLE LEVEL. Under the heading BEDFORD LEVEL, a remarkable district, covering 400,000 acres, is described, bounding the Wash on all sides except seaward, extending landward nearly to Brandon, Cambridge, Peterborough, and Bolingbroke, and embracing portions of the six counties of Northampton, Huntingdon, Cambridge, Lincoln, Norfolk, and Suffolk. It nearly coincides in area with what is popularly known as the Fens. The whole region was, centuries ago, converted into an unprofitable marsh by repeated incursions of the sea, coupled with obstructions to the outward flow of the rivers Nene, Cam, Ouse, Welland, etc. Vast operations have been carried on ever since the time of Charles I., by digging new channels and outfalls, and employing windmills and steam-engines to pump the water from the marshes and ponds into these artificial channels. The Bedford level is divided into the *North*, the *Middle*, and the *South levels*, managed by commissioners, whose powers are derived from special acts of parliament. The improved value of the land is the fund out of which the expense of the engineering works is defrayed. It was in one of these districts (the Middle level, between the Nene and the Old Bedford river) that an irruption took place in 1862, which strikingly illustrates the dependence of the safety of the whole region on well-formed and well-maintained embankments. There was a sluice, called St. Germain's sluice, situated at the confluence of the Middle level main outfall drain with the river Ouse, near the upper end of another artificial channel, known as the Eau Brink cut. The drain was made in 1847, and was enlarged ten years afterwards to a bottom-width of 48 ft., a side-slope of 2 to 1, and a level of 7 ft. below low-water spring-tide in the river; the rise of high-water spring-tide at that point was 19 ft., and the sill of the sluice was 6 ft. below low-water spring-tide.

On May 4, 1862, this sluice gave way without the slightest warning; the tidal waters undermined the brickwork, and formed a hole in the bed of the river, into which the works of the sluice sank. The tidal waters rushed up the opening, and ebbed and flowed throughout a distance of 20 miles. The commissioners of the Middle level applied to Mr. Hawkshaw, the engineer, to devise means for repairing the disaster. An earth and cradle-dam was attempted to be thrown across the drain, at about 500 yards from the fallen sluice; but this was relinquished in favor of a permanent coffer-dam of pile-work, at a distance of half a mile from the sluice; and after incessant exertions from May 16 to June 19, the tidal waters were at length effectually shut out by a strong dam. The failure of the St. Germain's sluice was not the only irruption that had to be battled with; eight days after that failure, under the pressure of a high spring-tide, the west bank of the drain gave way, on May 12, at a point about 4 miles from the sluice; the bank had been built only to resist upland waters, and not a rush and a pressure of the sea. The rupture carried away 70 yards of the bank, scouring out a hole 10 feet deep at the spot, and admitting a rush of water which covered 6,000 acres of fertile land to a depth of 2 or 3 feet, increased at successive high-tides to 10,000 acres.

When the finishing of the dam had enabled Mr. Hawkshaw to shut out the tidal waters, means had to be devised for getting rid of the flooding waters, and providing an outlet for the usual rivers and land-drainage of the Middle level. It was resolved to utilize some of the old outlets at other spots, and to supplement their action by enormous siphons, placed over the coffer-dam. Sixteen siphons were provided. They were made of cast iron, 3 feet 6 in. internal diameter, and somewhat over 1 in. thick; they rested on the top of the dam, and on inclined framework supported by piles at the sides. The valves were so arranged, that the siphons could be put in operation, either by exhausting the air or by filling them with water. When only six of the siphons were in position, they carried 50,000 gallons of water per minute over the dam.—For more minute details of the dam and the siphons, see Mr. Hawkshaw's paper read before the institute of civil engineers in 1863.

There are large items both of cost and of compensation in works of this kind. Nearly the whole of the Middle level is 15 feet below high-water spring-tides; it is difficult to keep out the sea-water, and at the same time to preserve an outlet for the land-water, especially Whittlesea mere; there are 130,000 acres to be drained somehow or other; but as the land is rich for farming, the commissioners, in past years, did not hesitate to spend £400,000 on 11 miles of drain, and £30,000 on the sluice. The drain runs through a district called *Marshland*, between Linn and Wisbeach; and as the bursting of the bank caused this district to be deluged with water, the commissioners have had to compensate the Marshland farmers and others; the amount of this compensation was frequently litigated between 1862 and 1867. As concerns the land itself, it is found to be more fertile after such inundations than before, owing to the amount of silt deposited on the fields. After repairing the breach in the bank, the 10,000 inundated acres were drained without much difficulty, through the Marshland, Smeeth, and Fen drain, and the Marshland sewer; the siphons are permanent channels, to carry off the usual land-waters regularly. The siphons were subjected to a severe trial in Jan., 1867, by the ice which accumulated around their lower ends; but iron gratings effectually resisted the entrance of the ice into the siphons.

MIDDLE PARK, one of the numerous fertile valleys which extend over broad distances in Colorado, being inclosed by spurs of the Rocky mountains, and remarkable for the variety and picturesque character of their scenery. It is in Summit co., about 3,000 square miles in extent, being 65 m. in length by 45 in width, and is 7,500 ft. above the level of the sea. It lies directly s. of North park, from which it is separated by one of the cross ranges of the great mountain chain. On its eastern side the Snow-range or continental divide sweeps around it, and it is completely surrounded by lofty mountains, among which Long's peak, Gray's peak, and Mt. Lincoln, from 13,000 to 14,000 ft. high, stand prominent. The head-waters of Grand river and the Blue river water this territory, both flowing westward to the Colorado. A portion of the park is heavily wooded, but much of it presents an expanse of grass-grown meadows, dotted with wild-flowers. Wild game is plentiful, and includes bears, elk, mountain-sheep, deer, and antelopes, and the waters are filled with fish. The climate is genial and the temperature equable. The most important feature of the park for tourists is the hot sulphur springs, 45 m. from Georgetown and 60 m. from Central City. These springs are found near a branch of the Grand river, about 12 m. from the southern termination of the park. Their waters are said to exercise a curative influence in cases of cutaneous disease, rheumatism, and neuralgia. About these springs a settlement for the accommodation of invalids is rapidly spreading into a considerable town. Grand lake, a handsome sheet of water, offering excellent trout and other fishing, is 27 m. from the Hot Springs, and is a point much frequented by excursion parties of tourists and convalescents.

MIDDLESBROUGH, the center of the n. of England iron manufacture, is an important market t., port, and parliamentary borough in the North Riding of Yorkshire, at the mouth of the Tees, 48 m. n.e. from York, returning one member to parliament. The town is of recent growth, and owes its origin as a port to its convenient position for the

shipment of coals brought down by railway from the mines in South Durham. In 1842 a commodious dock was constructed, which has recently been very considerably enlarged, and will admit ships of the largest tonnage.

On the discovery, in 1840, of immense beds of ironstone, extending throughout the whole range of the Cleveland hills, a portion of which lies close to the town, the smelting of iron was speedily embarked in on an extensive scale, which has since increased to a marvelous extent, to which has been added iron-foundries, the manufacture of rails, locomotive engines, tubes, boilers, etc.; chemical works, potteries, and ship-building are also carried on to a large extent. The town of Middlesbrough was incorporated in 1853, and constituted a parliamentary borough in 1868, is well built, and some of the streets present handsome specimens of architecture. The royal exchange, built in 1867, is a large and handsome building; within its spacious interior the weekly iron-market is held on Tuesdays, and is attended by parties connected with the iron trade from all parts of the kingdom, as well as foreigners. There are five churches of the national establishment, and numerous places of worship connected with the various religious denominations. Albert park, containing 72 acres, is tastefully laid out.

At the census taken in 1831 Middlesbrough was an obscure hamlet with 383 inhabitants; in 1871 the parliamentary borough contained a pop. of 46,643, and in 1874 it was estimated at upwards of 60,000.

MIDDLESEX, a co. in s. Connecticut, intersected from n. to s.e. by the navigable Connecticut river, emptying into Long Island sound, which forms its s. boundary; 400 sq.m.; pop. '80, 35,587—29,611 of American birth, 387 colored. It is drained by the Hammonassett river in the s., and the Salmon river, a branch of the Connecticut, both furnishing water power. It is intersected by the Connecticut Valley railroad, the Shore Line (N. Y., N. H. and Hartford), and the Boston and New York Air Line. Its surface is hilly and well wooded, and celebrated for the beauty of its scenery, the picturesque bluffs and terraced banks of the river. Its soil is not in general very fertile, except in the celebrated Connecticut valley: yet, well fertilized, it produces grain, garden produce, tobacco, a variety of orchard products, and those of the New England states in general. Among its variety of manufactures are Victor sewing-machines, brittania ware, tape, webbing, pumps, sleigh and hand bells, augurs and gimlets, ivory and bone goods, emery wheels, and engine-governors, etc. Granite, cobalt, and freestone are found, and valuable quarries of the celebrated Portland sandstone, which is largely exported for building-material. Capitals, Middletown and Haddam.

MIDDLESEX, a co. in e. Massachusetts, having the state line of New Hampshire for its n. boundary, drained by the Merrimac and Nashua rivers in the n., and the Charles, Concord, Sudbury, and Assabet rivers in other sections; 800 sq.m.; pop. '80, 317,951—234,665 of whom are of American birth, and 2,675 colored. It is intersected by a net-work of railroads; the Boston and Albany, branches of the Boston, Lowell and Nashua, the Boston, Clinton, Fitchburg and New Bedford, and the Boston and Maine. Its surface is hilly, and groves of oak, white ash, beech, elm, hickory, and other trees grow on the hills along the river banks, which are celebrated for their quiet beauty. Its soil is very fertile, producing large crops of corn, potatoes, and other garden and orchard produce. Horses, cattle, sheep, and swine are raised. The immense water power furnishes facilities for extensive manufactures, which command the attention of the inhabitants, somewhat to the exclusion of agriculture. They consist of a large variety, among them cotton and woolen goods, straw goods, boots and shoes, leather, carpets, and watches (at Waltham). The value of the manufacture of boots and shoes for one year is estimated at over $16,000,000, and of cotton goods at over $12,000,000; the reported annual value of all manufactures for one year is $113,147,270. The county includes the cities of Lowell and Cambridge (the seat of Harvard university), and the towns of Medford (the seat of Tufts college), Lexington, and Concord (the home of Emerson, and the seat of the Concord school of philosophy). Capitals, Lowell and Cambridge.

MIDDLESEX, a co. in e. New Jersey, having Staten Island sound and Raritan bay for part of its e. boundary, drained by the Raritan river, navigable to its county seat, flowing through it and forming its n.w. border, and emptying into the bay of the same name; also the South and Millstone rivers; 340 sq.m.; pop. '80, 52,286—42,162 of American birth, 1628 colored. Its surface in the n. portion is hilly, but in the s. is generally level. It is a fine agricultural region, the soil being in some portions light and sandy, and in all parts fertile. Its products include corn, wheat, and dairy products, and fruit in abundance. Cattle, sheep, and swine are raised. Sandstone is found, fire-clay or kaolin, and molding-sand. It is intersected by the railroad of the united companies of New Jersey, the Lehigh Valley railroad, and the New York division of the Pennsylvania railroad. The Millstone and New Brunswick railroad and the Delaware and Raritan canal terminate at its county seat, and a portion of it is traversed by the Freehold and Jamesburg agricultural railroad. It has extensive manufactures of India-rubber goods, carpets, hosiery, cork, paper-hangings, metal screws, white-ware, drain pipes, freight and passenger cars, harness, shoes, etc. Across the sound, 1 m. in width, is Staten Island 13 m. long, 5 m. s.w. of the city of New York. The harbors of the county are easily accessible to vessels, and have 4 ship-yards. A large number of steamboats and steam ferry-boats ply between its ports and neighboring cities. Seat of justice, New Brunswick.

MIDDLESEX, a co. in e. Virginia, having the Chesapeake bay for its s.e. boundary, the Rappahannock river for its n., and the Piankatauk river for its s. border; 150 sq.m.; pop. '80, 6,252—6,242 of American birth, 3,634 colored. Its surface consists mostly of level plains with low marshes in some sections. Its soil is a sandy loam, producing wheat, oats, corn, and dairy products. Cattle, sheep, and swine are raised, and oysters are abundant. Seat of justice, Saluda.

MIDDLESEX, a co. in s.w. Ontario, drained by the Thames river, forming part of its s.w. boundary; about 1228 sq.m.; pop. '71, 82,595. It is intersected by the Great Western railway, the branch railroad to Sarnia, the London and Port Stanley railway, the Grand Trunk, and a branch from St. Mary's. It is a fine agricultural region, and has white sulphur springs in the e. portion. It has 3 ridings. It is also supplied with water power by the Aux Sables and Sydenham rivers; and has extensive iron-foundries, machine shops, chemical works, breweries, and manufactories of boots and shoes, soap, candles, musical instruments, carriages, cabinet-making establishments, and has a large trade in grain and country produce. Seat of justice, London.

MIDDLESEX, the metropolitan co. of England, in the s.e. of the country, bounded on the n. by Hertford, and on the s. by Surrey, and about 60 m. inland (westward) from the North sea, with which it communicates by the river Thames. Next to Rutland, it is the smallest of the English counties, its area being only 180,136 statute acres; but its population is inferior only to that of Lancashire, and was, in 1871, 2,539,756. The surface is on the whole level, with gentle undulations. The Thames, which forms its southern boundary, and its affluents, are the only rivers of the county. Two of these, the Colne and the Lea, form respectively the western and the eastern boundaries of the county. The surface is also traversed by the Grand Junction and Regent's canal, and the New river, an artificial cut intended to supply the capital with water. The soil is in general poor, with the exception of a tract along the banks of the Thames, which consists of a good fertile loam. The county is chiefly occupied in grass and hay farms, and in market-gardens, the produce of which is sent to supply the metropolis. Parliamentary elections of members for Middlesex are held at Brentford, which is the county town. There are no other towns of importance except London.

MIDDLE TEMPLE, one of the four English inns of court, having the exclusive privilege of calling persons to the bar. See INNS OF COURT.

MIDDLE THIBET. See LADAKH, *ante.*

MIDDLETON, a small manufacturing t. of Lancashire, 6 m. n.n.e. of Manchester. Pop. '61, 9,876; '71, 14,587. It is chiefly dependent upon its manufactures of cotton cloth and silks.

MIDDLETON, a small decaying market t of Ireland, in the county of Cork, and 13 m. by railway e. of the city of that name. It contains a college, founded in 1696, noticeable as the place in which John Philpot Curran was educated, and still of considerable reputation, and carries on a general trade. Pop. '71, 3,603.

MIDDLETON, ARTHUR, 1685–1745 about, was the son of Edward Livingston, and an eminent member of the South Carolina colony. The proprietary system, which existed under the royal charter, was obnoxious to the colonists, and in 1719, under the lead of Middleton, they succeeded in placing themselves under the immediate protection of the crown. He had previously (1712) been made a member of the council; and in 1725 succeeded Nicholson as governor, which position he held for six years, and for the remainder of his life was a member of the royal council.

MIDDLETON, ARTHUR, 1743–48, b. S. C.; educated at Harrow and Westminster, and at Cambridge. On his return to this country he took a prominent part in the affairs of his native state, where his family possessed large estates and exerted a great influence. His father, Henry Middleton, had been president of congress in 1775, and he himself, after serving with distinction on the first committee of safety, was sent by his native state in 1776 to congress, where he signed the declaration of independence. He remained in congress till 1777; and two years later, after refusing the governorship of South Carolina, he joined in the defense of Charleston. The British troops pillaged his plantation, one of the most valuable in the state; and in 1780 he was made prisoner at the capture of Charleston. His plantation was confiscated, and he was confined first at St. Augustine, and afterwards in the Jersey prison ship till near the close of 1780, when he was exchanged. He was again returned to congress, where he remained till the war was closed. He was afterwards a member of the senate of his native state. His writings are confined to a number of essays on political subjects, published under the pseudonym of "Andrew Marvell." To his skill as a stenographer we are indebted for a report of many debates in which he took part, and whose records would otherwise have been lost to us.

MIDDLETON, CONYERS, D.D., a well-known divine and scholar of the church of England, was b. in 1683 at Richmond, in Yorkshire. He studied at Cambridge, where he took the degree of B.A. in 1702, was elected a fellow in 1706, and shortly after married a lady of fortune. His life was a series of bitter, and, on the whole, not very creditable controversies, though he is said to have been rather a likable person in private. His first and most formidable opponent was Richard Bentley (q.v.); afterwards his polemics

were chiefly of a theological character. The views he expressed and defended were generally such as to draw down upon him the imputation of being an "infidel in disguise," though some of them—such as that the Jews borrowed some of their customs from Egypt, and that the primitive writers in vindicating Scripture found it necessary sometimes to recur to allegory—are now established beyond all doubt; while a third opinion, viz., that the Scriptures are not of absolute and universal inspiration, has since Middleton's day been adopted by many of the most learned and accomplished divines even of his own church. Middleton died at Hildersham, in Cambridgeshire, July 28, 1750. His principal writings are *The History of the Life of M. Tullius Cicero* (2 vols. 1741), a work both interesting and valuable, but neither very impartial nor quite accurate. His celebrated *Letter from Rome, showing an exact Conformity between Popery and Paganism; or the Religion of the present Romans derived from that of their Heathen Ancestors* (1729), provoked the most violent indignation among Roman Catholics, and is still read with interest. All his pamphlets, treatises, etc., were collected and published under the title of *Miscellaneous Works* (4 vols. Lond. 1752–57), and contain much that is curious and valuable on theological and antiquarian topics.

MIDDLETON, EDWARD, 1640–1700 about, the first of a family well known in the political history of this country, and especially of South Carolina. He was born in Twickenham, England, from which place he emigrated to this country and took up his residence in South Carolina, being one of the very earliest settlers. Here he took an active part in the affairs of the young colony and was useful not only from his great wealth but also from his political sagacity. He was of very liberal tendencies, and seems to have foreseen the separation of the colonies from the mother country. In 1680, ten years after the settlement of the colony, he was a member of the council under the lord-proprietors.

MIDDLETON, HENRY, 1771–1846, was the son of Arthur Middleton, signer of the Declaration of Independence, and was b. in Charleston, S. C. He was a member of the state legislature 1801–10; was then elected governor of the state and in 1815 was elected to congress, where he served two terms. In 1820 he was appointed U. S. minister to Russia, in which capacity he served for about ten years and on his return to this country retired from public life.

MIDDLETON, HENRY, b. not far from 1700, son of gov. Arthur Middleton, and like all his family, took much interest in the political affairs of the state. He is chiefly known as president of the congress of 1775, to which he was sent as a delegate by the colonial convention of South Carolina; and notwithstanding his great age at the time was an active and efficient supporter of the revolutionary measures.

MIDDLETON, THOMAS, d. 1626, b. England; lived in the reigns of Elizabeth, James I., and Charles I. Very little is known of his life beyond the fact that he was made chronologer to the city of London in 1620. His earliest known piece belongs to 1602 and his latest, to 1626. The best of his numerous plays are *A Mad World my Masters*, and *The Roaring Girl*. The latter is interesting from the picture it contains of the London life of that day. Its heroine was an actual person, the notorious Moll Cutpurse, who also figures in the *Amends for Ladies* of Field, a contemporary of Middleton. Another play of Middleton's, *The Witch*, is supposed to have furnished or suggested to Shakespeare, some of the incantation scenes of Macbeth. A tragedy founded upon the story of Bianca Capello is distinguished by a forcible action. The comedy, *A Trick to Catch the Old One*, is full of spirit and humor, as are most of Middleton's comedies. His language is often coarse, and his characters repulsive; he has little skill in the construction of a plot, but his works are full of life. He displays a richness of humor in his comedy, and an occasional power of imagination in his tragedy, which entitle him to a high rank among the Elizabethan dramatists of the second class. He worked with Rowley on the composition of *The Fair Quarrel*, *The Spanish Gipsy* and *The Changeling*, with Rowley and Massinger on *The Old Law*, and with Fletcher and Jonson wrote *The Widow*, printed in Dodsley's *Plays*.

MIDDLETON, THOMAS FANSHAWE, D.D., 1769–1822, b. England; educated at Christ's hospital, and Cambridge, and ordained in the English church in 1792. He was appointed to the curacy of Gainsborough in Lincolnshire, where for a time he edited a periodical called the *Country Spectator*. In 1794 he acted as tutor to the sons of the archdeacon of Lincoln, Dr. John Prettyman, who presented him in 1795, to the living of Tansor, in Northamptonshire, whence he was transferred in 1799, to St. Peter's, Mancroft. In 1802 he became rector of Bytham, in Lincolnshire, and began his most important book, a treatise on the *Doctrine of the Greek Article*, which appeared in 1808. In 1811 he became vicar of St. Pancras, Middlesex, and in 1814 was consecrated first bishop of Calcutta. In this capacity he did much to promote the advancement of Christianity and education. He founded the bishop's college at Calcutta in 1820, to educate missionaries and clergymen for the English Asiatic possessions, and he established a consistory court at the same place. In his book on the Greek article, after laying down the rules to which it is subject, and applying them to New Testament interpretation he attempts the discussion of passages from which the divinity of Christ may be argued for or against, according to the special force of the Greek article in that particular connection. The

work created considerable theological discussion, and was opposed by a number of Unitarian writers.

MIDDLETOWN, a city and township in Connecticut, United States, at the head of navigation, on the right bank of the Connecticut river, 23 m. from its mouth. It is a well-built town, with a handsome custom-house, Wesleyan university, episcopal seminary, 16 churches, four banks, 3 cotton factories, foundries, mills, etc. Pop. of city in 1870, 6,923.

MIDDLETOWN (*ante*), a city in s. Connecticut, incorporated 1874; on the Connecticut Valley railroad and the Boston and New York Air Line, at the terminus of a branch of the New York, New Haven and Hartford railroad; pop. '80, 11,731. It is a port of entry, admitting to the wharves vessels drawing 9 ft. of water. It is a stopping place for the New York and Hartford steamboats, daily line. It is built on rising ground, commanding a fine view of charming environs, and is situated on the w. bank of the Connecticut river, 31 m. above its mouth, directly s. of one of its small branches, and is one of the county seats of Middlesex county. It is regularly laid out, with wide streets at right angles; buildings principally of brick, and residences, particularly on the hills, having spacious grounds, tastefully ornamented. Main street, in the mercantile quarter, is a wide and level thoroughfare, and High street contains the most fashionable residences. The streets are well shaded by trees. It contains a court-house, built of Portland freestone; 6 hotels, 7 banks—4 national—with an aggregate capital of $969,300, and 3 institutions for savings, having $8,000,000 of deposits. It has a custom-house, 5 newspapers, 15 churches, and a public library. It is the seat of Berkeley divinity school (Episcopal), established in 1854, having a library of 14,000 vols.; also of the Wesleyan university (Methodist), organized 1831, having a library of 25,000 vols., a valuable cabinet, and fine telescope; and has excellent public schools. In the suburbs are the commodious buildings of the state general hospital for the insane, and it has also the state industrial school for girls. In the vicinity are valuable mineral deposits: feldspar, columbite (very rare), gold, silver, and an abandoned lead-mine opened in revolutionary times. It is 15 m. s. of Hartford and 24 m. n.e. of New Haven, at an equal distance from New York and Boston. It is the center of an important trade; has some shipbuilding, and various manufactures—among them britannia ware, silver-plated ware, cotton goods, sewing-machines, rules, chisels, guns, screws, etc. Across the river is the t. of Portland, connected with it by an iron railway bridge of the Boston and New York Air Line.

MIDDLETOWN, a village in Orange co., N. Y., the terminus of the New Jersey Midland railroad, at the junction of the Erie railroad with the New York and Oswego Midland railroad; pop. '70, 6,049. It is a part of the township of Wallkill, and is on the Wallkill river, built on the long, sloping sides of low hills. It is 24 m. w. of Newburg, and 66 m. n.w. of New York by rail. The Shawangunk mountains, a portion of the Appalachian system, lie at the w. of it, and on the e. are the highlands of the Hudson. It has 9 churches, 2 national banks, a savings-bank, several public halls (1 masonic), a public library and reading-room, a union school, Wallkill academy, and several private schools; and it is the seat of the state asylum for the insane (homeopathic) established 1874. It has an opera-house, two hotels, and 4 newspapers. Its streets are wide, ornamented with shade-trees, well sewered, and lighted by gas. It has an efficient fire department and police force. Its water-works conduct its water supply 2 m. from lake Monhagan, the reservoir containing 80 acres, situated nearly 200 ft. above the level of the village. In the s.w. portion is Hillside cemetery, a beautiful spot containing 50 acres, well laid out and carefully tended. Its leading industries are the manufacture of wool hats, blankets, saws, files, carpet-bags, furnaces, agricultural implements, lawn mowers, gloves, patent medicines, etc., and it is the center of an important country trade in garden produce and stock.

MIDDLETOWN, a t. in Dauphin co., Pennsylvania, 9 m. s.e. of Harrisburg, at the mouth of Swatara creek, on the e. side of the Susquehanna, and the Pennsylvania railroad and Union canal, and connected by ferry with the Middletown ferry station on the Northern Central railroad; pop. '70, 2,980. It has a number of churches, newspapers, a bank, and an orphan asylum. There are grist, planing, and saw mills, car and machine shops, and a foundry.

MIDDLEWICH, a small market t. of England, Cheshire, on the Grand Trunk canal, 20 m. e. of Chester. Salt is extensively made; boat-building is carried on, and brick-works are in operation. Pop. '71, 3,085.

MIDGE, the common name of many species of small dipterous insects, of the family *tipulidæ*, much resembling gnats, but having a shorter proboscis. Their larvæ are aquatic; the perfect insects are often very annoying both to human beings and to cattle. The little pink-colored tortuous worm known to anglers as the *blood-worm*, frequent in water-barrels and in the mud near the edges of ponds and ditches, is the larva of a species of midge (*chironomus plumosus*), a little larger than the common gnat, very abundant in Britain, particularly in marshy situations. The larva is much sought after both by birds and fishes, and is a very tempting bait for the latter. The pupa is cylindrical, with respiratory organs on the sides of the thorax. When the insect is ready to quit its pupa case,

it rises to the surface of the water and there remains suspended for a short time; the perfect insect, when it has issued from the case, also stands for a short time on the surface of the water. The genus is remarkable for the long hairs with which the antennæ of the male are furnished.—Another genus of midges (*simulia*) contains many species which are most tormenting to men and cattle, by entering the ears and nostrils, and alighting on the eyelids. Several species are British. They swarm on marshes and damp heaths in the warmer months. But none of them is nearly so mischievous as a species (*S. columbaschensis*) found on the banks of the Danube, and so plentiful, that horses and cattle are often suffocated by the numbers which get into the windpipe.

MIDHURST, a market t. and parliamentary borough of England, in Sussex, on the Rother, a navigable tributary of the Arun, 50 m. s.w. of London. Here are the ruins of an old castle of the Bohuns, lords of Midhurst; and within half a mile e. of the town stood Cowdry house, the seat of the Montagues, which, with the exception of the gate-house, was burned down in 1793. Midhurst returns one member to parliament. Pop. (1861) of parliamentary borough, 6,405; (1871) 6,753.

MIDIANITES, an Arab race, descended, according to Scripture, from Midian, the son of Abraham by Keturah. They occupied the greater part of the country between the n. side of the Arabian gulf and Arabia Felix as far as the plains of Moab. Others more civilized (if not, indeed, of Cushite origin) dwelt in the vicinity of the Sinaitic peninsula, and carried on a trade, particularly with Egypt. To the latter, we may presume, belonged Jethro, priest or "sheik" of Midian—the father-in-law of Moses. The Midianites were very troublesome neighbors to the Israelites till Gideon's victory over them. Their national god was Baal-Peor.

MIDLAND, a co. in central Michigan, intersected by the Flint and Père Marquette railroad; 550 sq.m.; pop. '80, 6,894—5,158 of American birth, 26 colored. It is drained by the Tittibawassee river, formed by the union of the Chippewa, Pine, and Tobacco rivers within its limits. Its surface is generally level prairie, largely covered with building timber, with groves of sugar maple, and pine growing on the low hills. Lumber is one of the chief commodities, and is largely exported. Its soil is fertile in some sections, producing oats, Indian corn, potatoes, wheat, rye, and the products of the dairy. Its soil and climate are favorable for stock-raising. It has manufactures of lumber, salt, and flour. Capital, Midland.

MIDLOTHIAN. See EDINBURGHSHIRE, *ante*.

MIDNAPOOR, a district in s.w. Bengal, forming part of the province of Orissa; 4,015 sq.m.; pop. about 500,000. It is traversed by the Cosai river and many smaller streams. The soil is rich and produces in abundance rice, sugar, tobacco, cotton, and indigo; but much of the district is jungle and the atmosphere is exceedingly unhealthy. Tigers and poisonous reptiles infest the district, and the annual loss of life from this cause is sometimes very large. The inhabitants are in religion partly Buddhists and in part Mohammedans. Midnapoor and Jellasore are the main towns; the former is the capital, and is 65 m. s.w. of Calcutta.

MIDRASH (Heb. *darash*, to search, explain the Scriptures) is the general name given to the exposition of the Old Testament, which for about 1500 years, formed the center of all mental activity, both in and out of the schools, among the Jews after the Babylonish exile. The prohibitions and ordinances contained in the Mosaic records, to which a precise meaning was not in all cases attached, were, according to certain hermeneutical rules, specified and particularized, and further surrounded by traditional ordinances and inhibitions: Halacha (q.v.) = rule by which to go, or the binding, authoritative, civil, and religious law. The chief codes of this are the Mishna (q.v.), Gemara (q.v.), Sifra (an amplification on Leviticus), Sifri (on Numbers and Deuteronomy), and Mechiltha (on a portion of Exodus). Another branch of the Midrash, however, is the Haggada (q.v.), a kind of free poetical homilectics on the whole body of the Old Testament (the Halacha being chiefly confined to the Pentateuch). The chief collections of that part of the Midrash are Midrash Rabba, 700 to 1100 A.D. (on Pentateuch and Megilloth), and Pesikta (700), the extracts from which (Jalkut, Pesikta, Rabbati, Sutarta, etc.) only are known, the original itself never having been printed.

MIDSHIPMAN, the second rank attained by combatant officers in the royal navy. After two years' service as naval cadet, the aspirant becomes a midshipman, which is rather an apprenticeship for his after-naval career than any really effective appointment. The midshipman's time is principally devoted to receiving instruction, both in the ordinary subjects of a gentleman's education, and in the special professional duties of a naval officer. After 1½ year's service as such, the midshipman is required to pass a qualifying examination in geography, history, and general knowledge; and two years later he must pass in French conversation, and in seamanship, steam, and gunnery. He then becomes a sub-lieut. (q.v.); and if 19 years of age, is eligible for promotion to lieut., whenever opportunity offers.

A midshipman only receives 1s. 9d. a day (£31, 18*s.* 9*d.* per annum); he is consequently dependent on his friends for more or less pecuniary assistance until he becomes a sub-lieutenant.

MIDSHIPMAN (*ante*), in the U. S. navy, is the ninth and lowest grade of officers in the line of promotion. The appointments for service are made from the cadet-graduates of the Annapolis naval academy, where the course of study lasts six years, and includes a very thorough training in theoretical and practical navigation, mathematics, the natural sciences, modern languages, etc. Cadets are appointed to the academy on the recommendation of the members of congress for the districts in which they reside, and on conditions similar to those governing the appointments to West Point. Since 1865 ten cadets are also appointed from among the apprentices of the school ships after a competitive examination. After passing the examination of the academy, the midshipmen receive their warrants and enter upon actual service, with the pay of $800 per annum. Promotion to the rank of ensign follows after two years' actual sea duty, and a strict examination before a board of three captains and two commanders.

MIDSUMMER DAY, one of the four English quarter-days for payment of rent by tenants, viz., June 24. See LANDLORD AND TENANT.

MIDSUMMER EVE. See JOHN'S (ST.) EVE.

MIDWIFE,—MIDWIFERY. Midwife (Anglo-Saxon, *med-wif*, meaning probably a woman hired for *mede*, or reward) is the name applied to a woman who assists in parturition or delivery. From this is derived the term *midwifery*, for that department of medical science which concerns itself with delivery, and its allied subjects. Writers who prefer words derived from Latin and Greek roots to such plain old English words as midwifery have substituted for it *obstetrics* (Lat. *obstetrix*, a woman who stands near, a midwife), and *tokology* (Gr. *tokos*, child-birth), or *gynækology* (Gr. *gyne*, woman); for a male practitioner in this line of the medical art the French name *accoucheur* is used; and recently an obnoxious new verb, *to accouch* (Fr. *accoucher*, to deliver a woman), has made its appearance in medical literature.

Midwifery, as a branch of medical science, is understood to include the study of the anatomy of the parts of the female body concerned; the doctrine of conception and of sterility, and the signs and duration of pregnancy; parturition in all its varieties; and the diseases peculiar to the puerperal state. To enter into details of such matters would be out of place in this work. With regard to parturition itself, it may be interesting to remark that in a vast majority of cases the labor is what is called "natural," that is, the child presents itself in the normal position, and unaided nature completes the delivery within 24 hours with safety to the mother and child. Dr. Smellie calculated that 990 in 1000 are "natural" labors; and the later statistics of Dr. Collins, based on 15,850 cases, give a similar result—viz., 983 in 1000.

"Unnatural" labor arises either from malformation, disease, or weakness on the part of the mother, or from abnormal conditions of the child; and manual or instrumental aid becomes necessary to prevent the labor from being dangerously prolonged, or—in the more extreme cases—to render delivery at all possible. Of instrumental applications, by far the most important and frequent is that of the forceps (q.v.), which is not intended to injure either mother or child. In 123,295 cases of labor attended by British practitioners, there were 342 forceps cases, or 1 in 360; of these about 1 in 21 proved fatal to the mother, while 1 child in 4 was lost. In craniotomy the head of the child is intentionally destroyed, with a view to save the life of the mother, the death of both being otherwise inevitable. Among British practitioners this operation is not often resorted to; it proves fatal to about 1 mother in 5¾. See also CÆSAREAN OPERATION.

History.—From all the passages in the Scriptures where midwifery is referred to, it is plain that women were the only practitioners of this art among the Hebrews and the Egyptians (see Gen. xxxv. 17, and xxxviii. 28, and Ex. i. 15–21), and it is equally certain that the Greeks and Romans confided this branch of medicine to women. Phanarete, the mother of Socrates, was a midwife; and Plato explains the functions and mentions the duties undertaken by these women. The Greek and Roman physicians were not ignorant of midwifery, for Hippocrates refers to the necessity of turning the child in certain cases, although his doctrines on this point, as also on the management of the placenta, are replete with danger, and Celsus, nearly four centuries later, treats of the mechanism of labor with great clearness. A gradual increase in the knowledge of this subject may be traced in the writings of Aëtius and Paulus Ægineta, who advocates the operation of craniotomy in certain cases. Rhazes seems to have been the first to advocate the rupture of the membranes, when, by their toughness, they impede labor; and Avicenna gave the first description of an instrument partially resembling the more modern forceps.

At the commencement of the 16th c. Eucharius Rhodion published a little book which soon acquired a great celebrity. It was translated from the original high-German into Latin, French, and English, and is remarkable as being the first book published on this subject in England. Its title is *The Byrth of Mankynde, otherwise named the Woman's Book*, by Thomas Raynold, physician (London, 1540), and it contains no external evidence that it is a mere translation. In 1573 Ambrose Paré published a small work in which he showed that foot-presentations were not dangerous, and that in mal-presentations it was better to deliver by the feet than to attempt to bring down the head.

In the early part of the 17th c. the *sage-femme* (the French term corresponding to our English midwife) of Marie de Medicis published a collection of observations on mid-

wifery. About this time (probably about 1640) Dr. Paul Chamberlen, an English physician, invented* the forceps with separate blades, such as are now used. The Chamberlen family (the father and three sons) did not, however, publish their discovery, considering that they had a right to use the secret in the way most to their own advantage; and the exact nature of their instruments was not known till 1815, when the tenant of a house near Maldon, in Essex, where Dr. Peter Chamberlen, one of the sons, had resided more than a century previously, accidentally discovered a concealed space, in which were, *inter alia*, a collection of obstetric instruments, including a double-bladed forceps and a vectis, which are now in the possession of the London medico-chirurgical society. Although Chamberlen's celebrated *arcanum* was doubtless the double-bladed forceps, he seems, therefore, also to have been the discoverer of the vectis or lever. In 1668 Mauriceau's Treatise appeared, which ran through seven editions, and was for a long time the standard work on the subject. He gives a very full account of the process of labor; and, his book having been translated into English, in 1672, by Hugh Chamberlen, became widely known in this country. This seems to have been the time when men began to engage generally in the practice of midwifery; Harvey, the Chamberlens, and others, taking it up in England; while La Vallière, the mistress of Louis XIV., did much to establish the practice in France by employing Julian Clement, a surgeon of high reputation, in her first confinement in 1663.

The last point requiring notice in the history of midwifery in the 17th c., is the discovery of the use of ergot of rye in accelerating parturition. In 1688 Camerarius stated that midwives in some parts of Germany were in the habit of employing it for this purpose; but it is not till 1774 that we find any further reference to the use of this drug.

In the early part of the 18th c. different varieties of forceps, closely resembling Chamberlen's instrument, were invented by Giffard, Chapman, and others; Chapman being, as it is believed, the first public teacher of midwifery in London. About the middle of this century lived sir Richard Manningham, who devoted himself to this branch of the profession, and established a small hospital for the reception of parturient women, which was the first of the kind in the British dominions. It is scarcely necessary to enter into further historical details, as midwifery was by this time fully recognized as a branch—although then and long subsequently considered as the lowest branch—of medicine. The names of Smellie, William Hunter, Denman, and Bland in England, and of Astruc and Baudelocque in France, are well known as promoters of various departments of the art of midwifery towards the close of this century.

In the present century the art of midwifery has steadily progressed. The by-laws precluding practitioners in midwifery from the fellowship of the London college of physicians, and other equally offensive rules in other institutions, have been repealed; there are professors of, or lecturers on, midwifery in all our medical schools (excepting at the universities of Oxford and Cambridge); and a knowledge of this department of medicine is now required from every candidate for the medical profession. And not only are the members of the medical profession compelled to be as well versed in midwifery as in medicine or surgery, but the ignorant midwives of past times are now replaced by comparatively well-educated nurses, with diplomas, certifying that they have regularly attended lectures on midwifery, and have taken personal charge of a certain number of labors under the superintendence of a qualified teacher. And that properly educated women are capable of undertaking all the responsibilities of this department of practice is shown by such cases as those of mesdames Boivin and Lachapelle, who (to use the words of prof. Velpeau), "although the pupils of Baudelocque, were not afraid to shake off, to a certain extent, the yoke of his scientific authority, and whose high position and dignity form the starting-point of a new era for the science of obstetrics in Paris."

MIE'RIS, FRANS, the elder, 1635–81; b. Holland; studied under Abraham Toorne Vliet, a celebrated Dutch designer, and afterwards under Gerard Dow, who called him the prince of his scholars. The subject which Mieris most frequently treats is domestic life. He was a brilliant colorist, and superior to Dow himself in his treatment of stuffs and textures, particularly rich materials like velvet and satin. His pictures are rare and command a high price. His portrait of the wife of Cornelius Plaats is considered one of his finest works. The Florence gallery has many of his pictures. His son, WILLIAM, 1662–1747, was also an artist. He had attained a considerable degree of skill under the direction of his father, upon whose death he turned his attention to making studies from nature. His earlier works portray domestic scenes, in the manner of his father; afterwards he took up historical and romantic subjects. His painting of Rinaldo sleeping in the lap of Armida, surrounded by the loves and graces, was so successful that he treated the same subject three times afterwards. He also painted in landscape and modeled in clay with considerable skill. His landscapes are not always natural, and in his historical compositions his costumes are often inappropriate. He is surpassed by his father in elaboration and exactness, but surpasses him in the brilliancy of his coloring and the

* The exact date of this important invention is not known, but in 1647 Dr. Peter Chamberlen published a pamphlet entitled *A Voice in Rhama*, in which he speaks of his father's (Dr. Paul Chamberlen) discovery for the saving of infantile life. Hence the forceps must have been invented in the first half of the 17th century.

representation of natural objects. FRANCIS MIERIS, sometimes called Francis the younger, 1689–1763, was the son of William, with whom he studied art. But he never attained high rank as an artist, his efforts in that direction being mostly confined to copying the pictures of his father and grandfather. His tastes were for historical and antiquarian researches.

MIEROSLAWSKI, LUDWIK, 1814–78; b. France; son of a Polish officer in the service of France, his mother being French. He received his education at the military school in Kalisz, and when only 16 years of age united himself with the Polish insurgents. This was at the beginning of the revolution of 1830, and Mieroslawski distinguished himself greatly, and was made an officer, serving through the campaigns of 1831 and until the fall of Warsaw, when he settled in Paris. Here he devoted himself to historical and other writing, publishing a number of books in Polish and French, particularly a military history of the revolution in Poland. He became the central figure of the club of Polish refugees in Paris, and, in 1846, took the command of another revolutionary movement, which failed, and resulted in his imprisonment and sentence to death. The outbreak of the general revolutionary movement of 1848 on the continent saved him from this fate, and he repaired at once to Poland on being released from prison in March of that year, and fought in a number of well contested engagements, gaining a complete victory at Miloslaw. But the insurgents were at length subdued, and Mieroslawski resigned his command. In the following year he was in command of the revolutionary movement in Sicily, and was wounded at Catania. He was next heard of in Baden fighting the Prussians, but here also he was unsuccessful, and after the capture of the fortress of Rastadt, in which he had taken refuge, he once more retired to Paris. The Polish insurrection of 1863 brought him again to the front, but only to be defeated in the battle of Raziejewo, after which he retired finally to France, and devoted the remainder of his life to political writing.

MIFFLIN, a co. in central Pennsylvania, drained by the Juniata river and its branches, and intersected by the Pennsylvania railroad and two local branches, and also by the Pennsylvania canal; 375 sq.m.; pop. '80, 19,577—19,090 of American birth. There are many hills, but in the valleys the soil is very fertile; wheat, oats, Indian corn, and potatoes being the staples. There are factories of woolen goods, axes, tools, clothing, harness, and saddles, 6 flour mills, and 11 tanneries. Co. seat, Lewiston.

MIFFLIN, THOMAS, 1744–1800; b. Philadelphia, of Quaker parentage. He received his education in the university of Pennsylvania, and in a business establishment. In 1765 he visited Europe, and on his return joined his brother in a copartnership, and rapidly attained to position and influence. In 1772 and the following year he was a member of the legislature, and in 1774 a delegate to the first congress. He was commissioned a maj. in one of the first regiments raised in Philadelphia for the war, and was aid-de-camp to gen. Washington, with the rank of col. He was rapidly promoted, becoming in succession quartermaster-gen. and adj.gen.; and commissioned brig.gen. May 16, 1776, and maj.gen. Feb. 19, 1777. During the retreat from Long Island he commanded the covering party, and was afterwards prominent in going through the country arousing the patriotism of the people by stirring appeals; he was enabled by this means to bring essential aid to gen. Washington before the battles of Trenton and Princeton. He became dissatisfied after the New Jersey campaign, and engaged in opposition to the commander-in-chief, being a prominent member of the movement known as the "Conway cabal." He was elected a delegate to congress in 1782, and became its president the following year. He was a member and speaker of the Pennsylvania state legislature in 1785, and a delegate to the constitutional convention of 1787. He held various state positions until 1791, when he was made governor, holding the office until 1800. He contributed greatly to the suppression of the whisky insurrection in 1794.

MIGNE, JACQUES PAUL, b. in St. Flour, Cantal, in 1800; educated at Orléans. In 1824 he became a priest and performed the functions of his office till 1833, when a pamphlet published by him, entitled *De la Liberté, par on Prêtre*, brought upon him the censure of the bishop of Orléans, who forbid its publication. Migne quit his pastorate, went to Paris, and the same year established *L'Univers Religioux*, designed to harmonize the church with the free spirit of civil government; but pleasing neither extreme his journalistic venture was assumed by others, and he commenced the publication of a collection of works entitled *Cours Complets de Théology et d'Ecriture Sainte*, and founded a publishing house on a large scale called *D'Imprimerie Catholique*, designed to furnish standard religious works at a low price. He established the daily *Verité*, which in 1856 became the *Courrier de Paris*. In 1861 he founded the weekly *Verité*, a religious journal. The publishing house was burned in 1868: 3,044,152 francs insurance received indicates the extent to which the establishment had grown. It was immediately rebuilt, Migne remaining its chief director. The *Cours Complet*, etc., first mentioned, finally grew into an immense series of volumes of standard authors under the general head of *Bibliotheque Universelle du Clergé et des Laïques Instruits*. The different parts of this series have had an immense sale.

MIGNET, François Auguste Alexis, a French historian, was b. May 8, 1796, at Aix in Provence, studied law in his native city along with Thiers, and went to Paris in 1821 to devote himself to a literary life. He found employment in writing for the public journals, and having given lectures on modern history, which were received with great approbation, he was induced to write his *Histoire de la Révolution Française* (2 vols. Par. 1824; 10th edition, 1840), a work in which that great event is regarded less in its moral than its philosophical aspects. It has therefore been reproached with leading to fatalism. His style is brilliant but academic. After the revolution of 1830 he became a counselor of state, and keeper of the archives of the ministry of foreign affairs; but lost these offices in 1848, since which time he has lived in retirement. He has edited *Négociations relatives à la Succession d'Espagne sous Louis XIV.* (4 vols. Par. 1836–42), to which he prefixed a masterly historic introduction. Among his later works are *Histoire de Marie Stuart* (2 vols. Par. 1851), and *Charles Quint, son Abdication, son Séjour et sa Mort au Monastère de Yuste* (1854); *Eloges Historiques* (1864); and *Rivalité de François I. et de Charles V.* For a *Histoire de la Réforme, de la Ligue, et du Règne de Henri IV.* he is said to have collected hundreds of volumes of manuscript correspondence.

MIGNONETTE', *Reseda odorata*, a plant of the natural order *resedaceæ*, a native of the n. of Africa, in universal cultivation on account of the delicious fragrance of its flowers. It is, according to circumstances and the mode of cultivation, an annual or a perennial, and even half-shrubby plant, with lanceolate entire or trifid leaves, and erect terminal racemes of small whitish flowers, which have the calyx 6-parted, and as long as the corolla; the capsules 3-toothed. It is to be seen during summer in almost every garden, and during winter in almost every green-house in Britain; it is often cultivated in flower-pots in apartments, and no flower is so common in the boxes which are placed outside of windows in towns. Yet it was first introduced into England by lord Bateman, who brought it from the royal garden at Paris in 1752; nor had it then been long known in France. It rapidly became a universal favorite throughout Europe. The French name mignonette, now its popular name everywhere, signifies *little darling*. What is called *tree mignonette* is not even a distinct variety, but merely the common kind trained in an erect form, and prevented from early flowering by pinching off the ends of the shoots.—Weld (q.v.) belongs to the same genus.

MIGRATIONS OF ANIMALS, which must not be confounded with their diffusion over a more or less extended area, are apparently always guided by an instinct operating on all, or nearly all, the individuals of a species, and leading them to move in a definite direction in search of food or (in the case of fishes) of a fit position for spawning.

Among mammals, such migrations are comparatively rare. The most remarkable instance is that of the lemmings, which at no definite epochs, but generally once or twice in a quarter of a century, traverse Nordland and Finmark in vast hosts, ending their career in the western ocean, into which they enter, and come to a suicidal end; or, taking a direction through Swedish Lapland, are drowned in the gulf of Bothnia. M. Martins, who was a member of the great scientific Scandinavian expedition, seems to doubt the generally entertained view of these animals casting themselves into the Western ocean, and believes that most of them perish from the cold in crossing the rivers, while many are killed by dogs, foxes, and a species of horned owl (*strix brachyotos*), which in large numbers always accompanies these emigrations.

According to Gmelin, the Arctic fox (*vulpes lagopus*) always accompanies the lemmings in such numbers that, on this ground, it is entitled to be considered a migratory animal; but independently of these special migrations, it is stated by sir James Ross that "the young generally migrate to the southward late in the autumn, and collect in vast multitudes on the shores of Hudson's bay; they return early the following spring to the northward, and seldom again leave the spot they select as a breeding-place."

The spring-bok (*antidorcas euchore*) is accustomed to make pilgrimages from one spot to another in the vast plains of southern Africa. Herds of many thousands are led by their chiefs in these migrations, and the wonderful density of the moving mass may be imagined from the fact that a flock of sheep has been inextricably entangled and carried along without the possibility of escape. Want of water is said to be the cause of these migrations, but Dr. Livingstone thinks that there must be other causes.

The occasional incursions of wolves, in very severe winters, into districts in which they are not commonly found, and the long excursions of large groups of monkeys (*eriellus* and *rhesus*), hardly fall within the scope of this article.

Many of the cetacea are probably migratory. "The migrations of the porpoise (*phocœna communis*) appear—says Marcel de Serres in his prize-essay, *Des Causes des Migrations des divers Animaux*, p. 63—to be as periodic as those of certain species of birds. During the winter, they constantly proceed from n. to s.; and when they feel the warmth of summer, they turn northwards. Thus they are common in summer in Greenland, while they are rare on our own coasts, where they abound in winter."

The number of species of birds that periodically migrate is so great that it is impossible to find space for a list of them. Marcel de Serres, in the work already quoted, gives a "Tableau de l'Epoque des Passages des Oiseaux," which extends over nearly 100 pages. See Birds of Passage. The desire for a suitable temperature and the search for their proper food are the apparent causes stimulating birds to these migrations; and in most

instances especially in the case of insectivorous birds, the food is intimately associated with the temperature.

The migrations of many species of fishes are as remarkable for their regular periodicity as those of birds. In some cases, fishes that are produced in fresh-water streams migrate to the ocean, and after spending some time in salt water, return (generally, with singular instinct, to their own birthplace) to fresh water to propagate their species. Some of these fishes—as, for example, the lamprey (*petromyzon marinus*)—spend most of their lives at sea, and others, as the salmon, in fresh water. The remarkable migrations formerly, but erroneously supposed to be made by herrings, are noticed in the article on that fish. Many fishes of the same family as the herring, the *clupeidæ*—as, for example, the sprat and pilchard—leave the deep sea for shallow water during the spawning period, when they approach our coasts in vast shoals. All such migrations as these seem mainly due to a reproductive impulse. See FISHES, LAND-CRAB.

Amongst insects, the locust (*locusta migratoria*) is most remarkable for its migrations. These insects are probably produced much more abundantly some years than others, and as in such years their birthplace cannot afford them sufficient vegetation, they are led to migrate in search of food. Some idea of the occasional extent of their wanderings may be formed from the fact that, in the early part of 1810, myriads of locusts appeared in Bengal, from whence they proceeded westward completely across the great Indian peninsula to Guzerat and the neighboring provinces, from whence they pursued their course southwards towards Bombay, the whole period of their migration extending over between two and three years; while, in relation to their numbers, capt. Beaufort calculated a swarm that appeared at Sardis, in Asia Minor, in 1811, at upwards of 168,000,000,000,000.

MIGUEL, Dom MARIA EVARIST, b. at Lisbon Oct. 26, 1802, was the third son of John VI. of Portugal. He spent his early years in Brazil, unrestrained and uneducated. When he returned with the royal family to Portugal in 1821, he could neither read nor write, and showed no talent for anything but fencing. He joined his mother, Charlotte Joachime of Spain, in her plots for the overthrow of the constitution and the establishment of a despotic government; part of the scheme being, that his weak father should be either formally deposed, or virtually deprived of all power. The aged marquis of Loulé, the faithful servant of the king, having been removed out of the way by assassination, Miguel, as infant-generalissimo, caused the ministers to be arrested, April 30, 1824, and his father to be closely watched in his palace; but the plot failed, and Miguel and his mother were banished. He led for some time a remarkably wild and profligate life in foreign countries. After the death of his father in 1826, the queen's party set forth a claim to the throne on his behalf, as his elder brother, Dom Pedro, was emperor of Brazil; and on May 2, 1826, Pedro resigned the crown of Portugal in favor of his eldest daughter, Donna Maria da Gloria, proposing that her uncle Miguel should be her husband, and regent of the kingdom till her majority, to all which Miguel agreed. But queen Joachime's party had everything prepared for the restoration of absolutism. Miguel was declared king of Portugal. War ensued, and at first Miguel was victorious. He carried into full effect the principles of his party by a system of the most severe repression of all liberalism, and signalized himself by the most extreme tyranny of every kind, whilst his own life was one of the wildest excess. In 1832 Dom Pedro took Oporto, and his arms gradually prevailing, Miguel was obliged to sign a capitulation at Evora, on May 26, 1834, by which he resigned all claim to the throne of Portugal, and agreed to retire altogether from the country. But scarcely had he been conveyed to Genoa, when he protested against this deed, and consequently all his estates in Portugal were confiscated, and an annual pension which had been secured to him was stopped. He went to Rome, where the papal government acknowledged him as rightful king of Portugal, solely because he had petted the Portuguese priesthood in his war against the national liberties. Latterly he lived at the castle of Bronnbach, in Baden, where he died Nov., 1866.

MIKADO. This is the popular title of the emperor of Japan, though in official documents the term tenno (heavenly king) or tenshi (child of heaven) are most frequently used. Other titles used in the native parlance or literature are nin-ō (king of men), o-ō or dai-ō (great king), ko-tei (ruler of nations). Other terms, arising from the application of the name of the mikado's place of residence to his person, are: dai-ri (imperial palace), chō-tei (hall of audience), kinri (the forbidden interior), go-sho (palace), which names occur frequently in old European works on Japan. The term mikado means honorable gate, like the Turkish "sublime porte," and the Egyptian "pharaoh." The dynasty of mikados is the oldest in the world, the present ruler Mutsuhito (q.v.), being the 123d of the imperial line. The first mikado was Jimmu Tennō, who began to reign 660 B.C., the professed starting-point of Japanese chronology. The first seventeen mikados in the official list are said to have died at ages ranging from 100 to 141 years. The mikados have each a personal name, but no family name, and the name of any one mikado is never repeated; though in two instances in the list, two mikados reigned each twice, and have each two posthumous titles. Seven of these sovereigns of Japan were females. The average duration of each reign is nearly 21 years. The mikados claim descent from the heavenly gods, and their regalia of sovereignty are a mirror, crystal ball, and sword. The possession of these palladia is the test of legiti-

macy during civil or dynastic war, of which but one is known in Japanese history—the period 1336–92, when a compromise was made by the rival in possession of the regalia receiving the title of ex-emperor, and handing over the sacred emblems to the other. After death, the mikado receives a posthumous title by which he is known in history. The mikado is allowed twelve *miogo* or concubines, besides the empress; and in addition, there are four noble families called shinnō, from whom heirs may be chosen for adoption. Succession is not always to the oldest son, but usually to the mikado's nominee. The imperial household forms a distinct department of the government, called the kunaishō.

MIKA'NIA, a genus of plants of the natural order *compositæ*, nearly allied to *eupatorium* (q.v.). The heads of flowers are 4-flowered, and have four involucral leaves. *Mikania officinalis* is a Brazilian species, with erect stem, and heart-shaped leaves, abounding in a bitter principle and an aromatic oil, and valuable as a tonic and febrifuge. *Mikania Guaco* and *Mikania opifera* also natives of the warm parts of South America, are among the plants which have acquired a high reputation—deserved or undeserved—for the cure of snake bites. They are twining herbaceous plants. *Mikania Guaco* is remarkable for the large indigo-blue spots on the under side of its ovate leaves. The mode of using this plant, which is one of those called GUACO, or HUACO, by the Indians, is by dropping the juice of the fresh leaves into the wound made by a serpent; or little cakes are formed of the bruised plants, which are said to retain their power for a long time. The whole subject requires investigation.

MI'KLOS (ST.) **TOROK,** a t. of Hungary, in the county of Heves, near the Theiss, about 70 m. s.e. of Pesth, with which it is connected by railway. Pop. '69, 13,024, chiefly employed in rearing horses and cattle, and in fishing.

MIKLOSICH, FRANZ, the most learned living Slavist, was b. at Luttenberg, in the Slavic part of Styria, Nov. 20, 1813. After studying law at the university of Grätz, he went, in 1838, to Vienna to practice as an advocate; but in 1844 obtained a situation in the imperial library. In 1850 he was appointed professor of Slavic in Vienna. His principal works are—*Radices Linguæ Palæoslovenicæ* (Leip. 1845); *Lexicon Linguæ Palæoslovenicæ* (Vienna, 1850); *Vergleichende Grammatik der Slaw. Sprachen* (1852–71), a work which has done for Slavic what the works of Grimm and Diez have done for German and Romanic. *Die Bildung der Slaw. Personennamen* was published in 1860; and *Die Zigeuner Europas* in 1872–77.

MI'KNAS, ME'QUINEZ, or MEKNAZA, a t. in the province of Fez, in Morocco, 38 m. w. by s. from the town of Fez, stands in a fertile valley near the Sebu. It is surrounded by triple walls and a moat, is neat and well built, and contains the finest imperial palace in Morocco. This vast pile, erected by the sultan Muley Ismail, is built of marble, and the surrounding grounds are laid out in gardens, said to be the most beautiful in Morocco, and here and there adorned with fountains. Miknas is the summer residence of the sultan. Pop. estimated at from 15,000 to 55,000, who carry on an extensive trade in native produce. The chief manufactures are of painted earthenware and leather. In the vicinity are large plantations of olives.

MI'LAM, a co. in central Texas, drained by the Brazos and Little rivers and many tributaries of the latter, and intersected by the International railroad; 1150 sq.m.; pop. '80, 18,659—3,952 colored. The surface is uneven and hilly, and in large part covered by forests. The staples are cotton, Indian corn, sweet potatoes, wool, and butter. Sheep grazing and cattle breeding are carried on to a considerable extent. Chief town, Cameron.

MIL'AN, a province in w. part of Lombardy in n. central Italy; bounded n. by the province of Como, e. by Bergamo, s. by Cremona and Pavia, and w. by Pavia and Novara; 1155 sq.m.; pop. '72, 1,009,794. It is drained by the Ticino, which separates it from Piedmont on the w., by the Addio on the n., and also by the Lambro, Olona, and other branches of the Po. The province is traversed by railroads leading to Venice, Como, Parma, and Turin. When subject to the Austrian power the area of Milan was but about 746 sq.m., and it was divided into 15 districts; but in the readjustment of boundaries which followed the establishment of Italian unity and the kingdom of Victor Emmanuel, it was considerably enlarged. Besides the capital, Milan, the only town of any size is Monza, 10 m. n.e. of Milan on the river Lambro, which has about 20,000 inhabitants, and is specially noteworthy for its old cathedral. The portraits of all the sovereigns who have worn the iron crown of Lombardy are to be seen at Monza. The surface of the province of Milan is level, it being a part of the great plain of Lombardy, and the country is intersected by many canals for irrigation; by which means the soil is rendered exceedingly productive. The staple products are fruit, corn, rice, and silk. The cattle are unusually fine. There are many flourishing villages, farms, and country seats; and the whole aspect of the province is indicative of great prosperity. It is now divided into the districts of Abbiategrasso, Gallarate, Lodi, Milan, and Monza.

MIL'AN (Ital. *Milano*), the chief city of Lombardy, stands on the river Olona, in the center of the great plain of Lombardy. Pop. (1872) of city, 199,009; of surrounding district, called Corpi Santi, 62,976. From its position on the line of the chief routes of

the central Alps it derives great commercial advantages, while its fine canal system opens for it communication with the principal rivers of Italy. The *Naviglio Grande*, or Grand canal, connects Milan with the Ticino, and the Martesana canal with the Adda. The city, which is almost circular, is encompassed on three sides by walls and low ramparts; it has a circuit of about 7¾ m., and is entered by 10 gates. Notwithstanding its great antiquity, Milan possesses but few remains of its early splendid structures, in consequence of the many calamitous wars by which it has been ravaged. Modern Milan is one of the most opulent and populous cities of Italy; its best streets are regular, wide, and well paved, and kept with scrupulous care; the dwellings are commodious and tasteful, though of a less imposing character than the great feudal Tuscan houses. Milan abounds in churches worthy of note: of these the principal is the famous Gothic cathedral, the *Duomo*, which, with the exception of St. Peter's in Rome, is the most magnificent ecclesiastical structure in Italy. It has a façade of white Carrara marble, and is adorned by 106 pinnacles and 4,500 statues, besides a variety of carvings of unsurpassable beauty. In form it is a Latin cross, with a length of 485, and a breadth of 252 ft. The height of the dome is 355 ft. Its foundation was laid in 1386 by Gian Galeazzo Visconti, and during its erection many of the greatest European architects contributed designs for its embellishment. Within it Napoleon was crowned king of Italy in 1805. Besides the Duomo may be mentioned the church of St. Ambrose (founded by that saint in the 4th c.), the most ancient in Milan, containing inscriptions, sarcophagi, and monuments full of antiquarian interest, and the one in which the German emperors were crowned kings of Italy; the Dominican church of *Santa Maria delle Grazie*, which contains in its refectory the famous "Cenacolo," or "Last Supper," by Leonardo da Vinci; and that of San Carlo Borromeo (1847); of St. Nazaro, which possesses several masterpieces of the best schools of Italian art; and of St. Sebastiano, once a Roman temple.

Among the secular buildings of Milan, the most noteworthy is the magnificent Brera palace, formerly a Jesuit college, and now used for public schools of the fine arts, with the official name of Palace of Arts and Sciences. Within its vast precincts this unique institution includes an academy of art, a choice gallery of paintings of the Bolognese and Lombard schools, a fine collection of casts for modeling purposes, a splendid public library, containing 140,000 volumes, and a rare collection of manuscripts, medals, and antiquities; it has also attached to it an observatory and a botanical garden. Besides the Ambrosian (q.v.), there are several large private libraries. Among the scientific and artistic institutions of Milan are the museum of natural history, the schools of surgery and medicine, especially that of veterinary practice, the celebrated conservatory or school of music, and a military geographical institute, well known for the excellence of the maps it has issued. The educational establishments include four gymnasia, besides normal schools, technical schools, conventual schools, and a seminary. The charitable institutions are numerous and splendidly endowed, having an aggregate property of upwards of £7,000,000 sterling; the *Ospedale Maggiore*, or Great Hospital, founded by the ducal house of Sforza in 1456, accommodates 2,000 patients, and annually admits upwards of 20,000. The Trivulzi hospital, endowed by the Trivulzio family, maintains and clothes 600 aged pensioners. The Milanese places of amusement are on as grand a scale as the other public buildings of the city, the first in point of celebrity being the theater of *La Scala*, which can accommodate 3,600 spectators. The *Corso*, or chief street of Milan, is the universal fashionable promenade of the inhabitants; and the famous arcade, or *Galleria di Cristoforis*, with its brilliant shops and cafés, is also a favorite place of evening resort, and on account of its gay appearance has been called "Little Paris." Milan carries on an immense inland trade in silk, grain, rice, and cheese, and has considerable manufactures of silk goods, ribbons, cutlery, and porcelain.

Milan (Lat. *Mediolanum*) was originally a t. or village of the Insubrian Gauls. It was conquered by the Romans 222 B.C., received the Latin franchise about 89 B.C., and the full Roman franchise 49 B.C. Under the Romans it became a conspicuous center of wealth and civic influence; its citizens were noted for their refined manners and literary tastes, and the public buildings for their beauty and elegance. In the beginning of the 4th c. it was selected as the residence of the imperial court by Maximian. Milan was sacked by the Huns (under Attila) in 452, by the Goths (under the brother of Vitiges) in 539, and passed to the Longobards and Franks previous to its subjection by the German empire. After 961 it was long governed by dukes in the name of the emperors. The feuds of the Guelphs and Ghibellines distracted Milan, like all the other Italian cities. Supreme power became eventually vested in the Ghibelline Visconti, by whom the ascendency of Milan was extended over the whole of Lombardy. From 1545 to 1714 Milan submitted to the successive predominance of France and Austria. Under Bonaparte it was declared the capital of the Cisalpine republic, or the Italian republic, and, finally of the kingdom of Italy. In 1815 Milan was restored to Austria, and continued the capital of the Austro-Italian kingdom until the annexation of Lombardy to Piedmont, in 1850, by the peace of Villafranca.

MIL'AN, ARCHBISHOPRIC OF. Of its early history we have no certain knowledge. There is a tradition that the apostle Barnabas established the Christian church at Milan, and was its first bishop. The first bishop of Milan of whom we have any knowledge is

Auxentius, 355–74. He was the leader of the Arians in the western church. The orthodox bishops, who at a synod assembled at Rome in 369 condemned Arianism, feared to pronounce against Auxentius because he was protected by the emperor Valentinian I., and, though the synod was prevailed upon by Athanasias to condemn him, he remained in his see till his death. The contest arising from the Arian heresy rendered the election of a new bishop very difficult, and Ambrose, the consular prefect, found it necessary to proceed to the church at Milan for the purpose of restoring order. At the close of his speech both the orthodox and the Arians united in a demand that he should be their bishop. He accepted, and acquired great influence with the people and the emperor Valentinian. He vigorously opposed the Arians, and in 382 presided at a synod which deposed the Arian bishops Palladius and Secundianus. All the bishops who succeeded Ambrose were elected by the people. After the overthrow of the Gothic kingdom, the archbishops of Milan, on account of the hostility between the people and the Lombards, their conquerors, resided at Geneva. But afterwards the Lombards became enthusiastic friends of the church, and the archbishops returned to Milan. Though the first bishop in the kingdom, and having the power even of crowning the king with the so-called *iron crown*, the archbishop was yet subject to the king, and the church was subordinate to the state. After the overthrow of the Longobard kingdom, the power of the archbishops of Milan was much reduced, but they subsequently became more independent than before, large feudal estates being bestowed upon them, and they were the most influential allies of the German emperors. Eriberto di Argago, archbishop of Milan 1019–45, organized in 1034 a revolt against the emperor Conrad the Salic, and was expelled. After his death, in the excitement prevailing over the election of his successor, the popular chief Erlanbaldo persuaded the people to select four candidates, from whom a choice should be made. These names were sent to the emperor Henry II. to make the appointment, but influenced by a faction of the nobles he appointed a rival, Guido di Valate. This appointment was disliked, both by the people on whom he was forced, and by the disappointed candidates. Milan was at one time independent of the papacy, the spiritual and temporal power being granted by the emperor. But the German popes began to interfere. Pope Leo IX. and his successors attacked the Milanese clergy, who at that time were allowed to marry, and in a council held at Rheims in 1049 laws were enacted against clerical marriage. Archbishop Guido defended the clergy both by Scripture and by a decision of Ambrose which he cited. The popes sent their emissaries, who excited great tumults in Milan, which Guido, who argued in favor of the married clergy, was unable to quell. The people rose in arms and resisted the papal faction, which resulted in fights and bloodshed. Nicholas II., then pope, sent Hildebrand and Anselm to allay the strife. Anselm was conciliatory, but Hildebrand demanded unconditional submission to Rome. In 1059 another papal legation was sent with full power to compel submission from the archbishop and clergy. These ecclesiastics at first earnestly denied the authority of Rome, but finally acknowledged it, signing a paper in which they expressed their penitence in humiliating terms. But when in 1061, after the death of Nicholas, their fellow-citizen Anselm was elected pope under the name of Alexander II., the church of Milan endeavored to regain its independence. A council of German and Lombard bishops convened at Basle and elected Cadalus, who was bishop of Parma, pope under the title of Honorius II. The German bishops, under the influence of Hanno, archbishop of Cologne, sided with Alexander, and in 1064 the synod of Mantua deposed Honorius. Guido, the archbishop, was excommunicated by the pope in 1066, but disregarding the deposition he appeared at the altar to officiate at the services of Pentecost day. The papal party attacked him in the church. His followers rallied for his defense, but he was nearly killed by the papists. A few months later Guido reorganized his party, and the war continued for several years. Hildebrand finally, in 1069, proposed that the Milanese clergy and laity should take an oath that in future their archbishops should apply for confirmation to the pope, not to the German emperor. Guido, weary of strife, resigned his archbishopric to his sub-deacon Gotefrido. He was confirmed by Henry IV., but the Milanese refused to receive him, and to save his life he escaped from the city. The papal appointee was also rejected, and compelled to swear that he would not attempt to enter the see. Milan was thus without an archbishop. Hildebrand, who succeeded Alexander, issued an interdict against it. The Milanese, disregarding the interdict, appealed to Henry IV. for an archbishop. He nominated Tedaldo, who was consecrated. He was the leader of the disaffected bishops who, at the synod of Pavia in 1076, excommunicated pope Gregory himself. He remained in his see till his death, notwithstanding the frequent excommunications from Gregory. With him ceased the independence of the Milan archbishopric. The clergy of Milan now largely belong to the Old Catholic party. The reforms which they seek are the election of priests by the parish, the use of the vernacular in the church service, the cessation of the worship of Mary and the saints, the marriage of priests, etc. E. Serra Gropelli is the leader of the reform party.

MILAZ'ZO (anc. *Mylæ*), a fortified seaport on the n. coast of the island of Sicily, 18 m. w. of Messina. Pop. '72, 7,744. Its situation is unhealthy. The chief exports are tunny, wine, silk, fruits, corn, oil, and liqueurs. The town is irregularly built, and is considered almost impregnable, owing to the great natural strength of its position and the extent of its military works and citadel. Garibaldi, with 2,500 men, defeated 7,000 Neapolitans here on July 20, 1860, and compelled the garrison to evacuate the fortress.

MILBURN, WILLIAM HENRY, b. Philadelphia, 1823; studied at Illinois college. In boyhood he lost totally the sight of one eye, and partially that of the other, and the skill of the most distinguished oculists in America and Europe failed to restore it. At the age of twenty he was admitted a preacher in the Methodist Episcopal church, his field of labor being chiefly in the southern states, and his pastorates at Montgomery and Mobile, Ala. He is said to have traveled in the period of his itineracy over 200,000 miles. In 1856 he was chaplain to the house of representatives at Washington. In 1859 he visited England with bishop Simpson and Dr. McClintock, where he delivered lectures with great success in the principal cities. On his return he was confirmed in the Protestant Episcopal church, but returned to the Methodist church in 1872. He is well known as the blind preacher, and as an eloquent lecturer. He has published *Rifle, Axe and Saddlebags; Ten Years of Preacher Life; Pioneers, Preachers, and People of the Mississippi Valley.*

MILDEW (Ger. *Mehlthau*, meal-dew), a term of somewhat vague application to certain diseased states of plants caused or characterized by the growth of small parasitical fungi, and also to spots on cloth, paper, etc., and even on the surface of glass and other inorganic substances, produced by the growth of minute fungi. The mildew fungi are numerous, and the name mildew is often given to many that are also known by other names, as BLIGHT, BRAND, BUNT, RUST, etc.; see these heads; see also BOTRYTIS and OIDIUM. Different species or families of plants have their own peculiar parasites; several kinds of parasitic fungus being, however, often known to infest one plant. Probably, the name mildew originally belonged to those molds which form white mealy patches on leaves. Some of these belong to the genus *Erysiphe*, which exhibits fleshy somewhat gelatinous masses, becoming globose *sporangia*, filled with spore-containing *asci*, and surrounded by a flocky *mycelium*, often spreading widely over the leaves and other parts of plants. Maples are sometimes covered with a mildew of this kind, so as to be quite hoary. Similar mildews are often seen on peas and other leguminous plants; also on umbelliferous plants. Sulphur has been found effectual in curing some of these mildews. Many of the most destructive mildews are of a red or brown color, as the mildew of the pear, *Aecidium cancellatum*, that of the barberry, *Aecidium Berberidis*, etc.; whilst some are almost black, as the corn mildew, *Puccinia graminis*, by which the crops are in some years greatly injured.

Whether mildew is the consequence of unfavorable weather and of fungi attacking an already weakened plant, or is the consequence of infection by spores of fungi brought through the air or soil to a plant previously healthy, is not yet well ascertained; and probably the one may be sometimes the case, and sometimes the other. There is no doubt that many kinds of mildew appear chiefly toward the close of summer on leaves in which vegetable life has already in a great measure lost its power.

MILE, the largest terrestrial measure of length in common use among the British and most continental nations, is derived from the Roman *milliare*, which contained 1000 paces (*mille passuum*) of 5 Roman ft. each, the pace being the length of the step made by one foot. The Roman foot being between 11.65 and 11.62 English in., the Roman mile was thus less than the present English mile by from 142 to 144 yards. The length of the modern mile in different countries exhibits a remarkable diversity, not satisfactorily accounted for. Before the time of Elizabeth, scientific writers made use of a mile of 5,000 English ft., from the notion that this was the Roman mile, forgetting the difference in value between the English and Roman foot. The present statute mile was incidentally defined by an act passed in the 35th year of the reign of Elizabeth to be "8 furlongs of 40 perches of 16½ ft. each"—i.e., 1760 yards of 3 ft. each; and it has since retained this value. The *geographical* or *nautical mile* is the 60th part of a degree of the equator, and is employed by the mariners of all nations; but in Germany, the geographical mile denotes $\frac{1}{15}$th part of a degree of the equator, or 4 nautical miles. The following table gives the length, in English statute miles, of the various miles that have been or are commonly used:

	Eng. Miles.
English geographical mile	=1.153
German geographical mile	=4.611
Tuscan mile	=1.027
Ancient Scotch mile	=1.127
" Irish mile	=1.273
German short mile	=3.897
Prussian mile	=4.680
Danish mile	=4.684
Hungarian mile	=5.178
Swiss mile	=5.201
German long mile	=5.753
Hanoverian mile	=6.568
Swedish mile	=6.648
The French kilomètre	=0.621

and 29 kil. =18 English statute miles nearly.

MILES, NELSON A., b. Mass. 1839; received an ordinary education, and took a position in a store in Boston in 1856. When the war of the rebellion broke out, he accepted a commission as first lieut. 22d Mass. volunteers, under date Oct. 1861, and was in the seven days' battles, and the engagement at Charles city cross-road. He was wounded in the battle of Fair Oaks, and again at Malvern hill. Between Fair Oaks and the change of base to Harrison's landing, he acted as adjt.gen. of the 1st brigade, 1st division, 2d army corps. Sept. 30, 1862, he was made colonel of the 61st N. Y. volunteers, and led that regiment at the battle of Fredericksburg. At Chancellorsville, he was dangerously, and, as was supposed, fatally wounded, and carried from the field; he however recovered, and during the campaign before Richmond in 1864, he commanded the brigade in which he had been acting as adjt.gen. His commission of brig.gen. was dated May 12, 1864; and he was brevetted maj.gen. Dec. 1864, for gallantry at the battle of Ream's Station. On Oct. 21, 1865, he was commissioned maj.gen. (volunteers); in July 1866 appointed colonel 40th infantry; transferred to 5th infantry Mar. 15, 1869; and brevetted brig. and maj.gen. U. S. army, Mar. 2, 1867. Since the close of the rebellion, gen. Miles has gained high praise as an Indian fighter, being engaged on the frontier, in the protection of the settlements, and in preserving order among the tribes in and out of the reservations.

MILE'TUS, anciently, the greatest and most flourishing city of Ionia, in Asia Minor. It was situated at the mouth of the Mæander, and was famous for its woolen manufactures, and for its extensive trade with the north. Before being forcibly colonized by the Ionians, it appears to have been inhabited by Carians. Miletus early founded a number of colonies on the Black sea and in the Crimea, possessed a fleet, which sailed to every part of the Mediterranean, and even ventured into the Alantic, and maintained long and expensive wars with the Lydian kings. The "Milesians" were believed to be the purest representatives of the Ionians in Asia. After the conquest of Lydia by the elder Cyrus, it was subdued with the whole of Ionia. It continued, however, to flourish till it was excited to rebellion against the Persians in the Ionian war, and was destroyed 494 B.C. It was rebuilt, but never reacquired its former importance. Miletus has an honorable place in the history of Greek literature, being the birthplace of the philosophers Thales, Anaximander, and Anaximenes, and of the historians Cadmus and Hecatæus.

MILFORD, a t. in s. Connecticut, on the s. shore, with a harbor on Long Island sound, a station on the New York, New Haven, and Hartford railroad, and another at the junction of the Naugatuck railroad with that road; pop. '80, 3,347. It is divided by the Wopewaug river, emptying into the sound; and the Housatonic river celebrated for its beautiful scenery washes its w. border. It is 11 m. s.w. of New Haven, and contains the factories of the Automatic book-sewing machine company, and manufactories of straw goods, boots and shoes, and carriages. It has excellent public schools, 1 newspaper, 1 savings-bank, 5 churches, and 2 hotels.

MILFORD, a village of Mass., 31 m. s.w. of Boston, having 6 churches, a manufactory of machinery, and large boot and shoe manufactures. Pop. '70, 9,890.

MILFORD (*ante*), a t. in e. Mass., on the Boston and Albany railroad, Milford branch, at its junction with the Milford, Woonsocket (R. I.) and Hopkinton railroad; pop. '80, 9,310. It is 18 m. s.e. of Worcester, and 14 from South Framingham. It has 2 banks (1 national), a town-house, 1 newspaper, a public library, and several tanneries. The township includes Milford Center, North, East, and South Milford, and Hopedale, all thriving villages.

MILFORD, a parliamentary borough (contributory to Pembroke) and sea-port of south Wales, in the county of Pembroke, on the n. shore of the haven of the same name, 7 m. e.n.e. of St. Ann's Head. The haven is said to be unequaled as a harbor by any other in the world. It is formed by an estuary running inland for 17 m. to Langwin (which is easily reached by vessels of 2,000 tons), and varying from 1 to 2 m. in breadth. It is protected from winds by a girdle of undulating hills, is deep (from 15 to 19 fathoms in most parts, while the spring-tides rise 25 ft.), easy of access, and capable of anchoring the whole fleet of England in safety. Its distance, however, from the channel, the highway of British commerce, is a serious disadvantage. The merits of the haven have been recognized from the earliest times; but the rise of the town of Milford may be said to have begun with the present century, when docks and quays, together with a mail packet station for Ireland, a dock-yard, ship-building slips, and an arsenal, were established here, only, however, to be removed in 1814. Since that time, with only occasional gleams of prosperity, Milford has been in a declining condition; but the opening of the Milford railway, and the construction of docks and wharfs, have given an impetus to its progress; though the trade of the place is little developed as compared with the capabilities of the haven and the mineral resources in the neighborhood. In 1875, 1262 vessels, of a burden of 263,804 tons, entered the port, and 1173, of 228,030 tons, cleared. Pop. '71, 2,836.

MILFORT, LE CLERC, 1750–1817; better known by his given name, a French adventurer, b. near Méziéres, and d. there. First a fugitive from justice in France he took refuge among the Creeks of Louisiana, where he acquired the title of "great warrior." During the revolution of 1789 he returned to France, and occupied various military positions in the army, where he distinguished himself often by the resources and bravery of

a brigand. In 1802 he published *Mémoires ou Coup d' Œil Rapide sur Mes Voyages dans la Louisiane, et Ma Séjour dans la Nation Creek.*

MILHAU, or MILLAU, a t. of France, in the department of Aveyron, in a rich and fertile dale on the right bank of the Tarn, 55 m. n.w. of Montpellier. During the 16th and 17th centuries it was one of the strongholds of the Calvinists. Leather and gloves are manufactured, and there is a good trade in wool, timber, hides, cheese, and wine. Pop. '76, 14,482.

MILITARY ACADEMY, ROYAL, an establishment at Woolwich, through which must pass all candidates for the royal artillery and royal engineers. The age for entrance is 17, and the vacancies are open to public competition. The pupils are denominated military cadets, and the parents or guardians have to make a considerable payment in regard to each, so long as they remain at the academy; the annual charge for the son of a civilian being £120, that for the son of a naval or military officer less, according to the rank of the father. When the term of instruction—which comprises the subjects of a thorough general education, the higher mathematics, fortification, gunnery, and military duty—is completed, the cadets compete for the vacancies in the engineers and artillery, those who pass the best examination being allowed the refusal of the former corps. Those who obtain commissions in the engineers proceed to Chatham for further instruction (with military pay, however) in their professional functions. The artillery cadets at once join the royal artillery as lieutenants. The vote for the royal military academy for the year 1879–80 was £31,287, of which sum about three-fourths would be made up to the exchequer by the payments for pupils and a contribution from the Indian government.

MILITARY ACADEMY, U. S. See UNITED STATES MILITARY ACADEMY.

MILITARY ASYLUM, ROYAL, an educational government institution at Chelsea, near, but wholly distinct from, the royal hospital for pensioned soldiers. Its object is the suitable education for trade, etc., of 500 male children—generally orphans—of British soldiers. For these there are a model school and an infant school, and the boys have a completely military organization, with scarlet uniform, band, etc. As a result of their training, a large proportion of the pupils ultimately volunteer into the army. The school was originally established in 1803 by the late duke of York, whence it is still commonly known as the "duke of York's school." Originally a similar school for soldiers' daughters was included, but was not found to answer, and has been discontinued. Attached to the school is a training establishment for military schoolmasters, known as the normal school. The total cost of the whole institution is about £11,500 per annum.

MILITARY LAW. See COURT MARTIAL; MARTIAL LAW.

MILITARY FRONTIER (Ger. *Militärgrenze*), the former name of a narrow strip of land along the Turkish frontier of the Austro-Hungarian empire. It had a special military constitution, and formed a separate "crown-land." Of late, however, the peculiar institutions of the Military Frontier have been abolished; portions of the territory have been incorporated with adjoining provinces; and since 1873 the remainder of the Military Frontier, now officially termed the Croato-Slavonic Border-land, forms, along with Slavonia and Croatia, a dependence of the Hungarian crown. The constitution, civil and military, is now accordingly similar to that of the other provinces of the Hungarian part of the empire. The area of the Military Frontier was about 7,500 sq.m., and its pop. in 1869 was 690,300. The breadth of the territory once known under this name is considerable towards the western extremity, but diminishes to only a few miles at the eastern. The surface has an average elevation of upwards of 2,000 feet. All the important rivers flow eastward. The climate is severe in the highlands of the w., but mild in the lower districts towards Slavonia. Maize, wheat, oats, fruits, and vegetables are the principal productions.

The Military Frontier owes its origin as a crown-land to the necessity of having a permanent body of defenders on the borders during former wars, and especially during wars with the Turks. In the 15th c. the Austrians had gained from the Turks certain tracts of territory on the banks of the Save and Danube. These tracts they colonized, making it, however, a condition that the colonists must render military service against the Turks. Thus originated the capitanate of Zengg, during the reign of Mathias Corvinus. The Warasdin Frontier originated in the same manner in the 16th, and the Banat Frontier in the 17th century. The constitution of the Military Frontier, as it existed till 1873, has been thus described: "The military stations along the frontier serve a threefold purpose —the defense of the country, the prevention of smuggling, and the prevention of the spread of contagious disease into the territories of the Austrian empire. The inhabitants of this crown-land enjoy peculiar privileges. Their immigrant ancestors received only the temporary use of lands consigned to them; but in 1850 a law was passed making over the land to the occupiers as their own property. This right of property does not belong, however, to individuals, but to the family in a united sense. The oldest member of a family (called the *hausvater*) is intrusted with the management of the land; his partner (the *hausmutter*) ranks equal with him, and they each receive a double share of the profits for the year as recompense for the management of the estate. A family of this sort is called a border-house (*grenzhaus*). All who are able to bear arms are sworn to the service from their 20th year. The soldier of the frontier, who is clothed as well as

armed and supplied with ammunition by government, finds it his duty not only to watch and protect the frontier, but to preserve peace and order in the interior, and to go on foreign service when required. Only the smaller portion of the forces of the Military Frontier is retained in readiness for active service, while the remainder pursue their ordinary employments. To facilitate the accomplishment of the purposes aimed at by the Military Frontier, the *cordon*, a series of guard-houses along the whole frontier, affording accommodation to from 4 to 8 men, as well as larger ones, accommodating 12 men and a junior officer, has been instituted. Within this line are the officers' posts. Without announcing himself at the posts, no one is allowed to pass the boundary; and after permission is given, the passenger must remain a longer or shorter time at the quarantine establishment, in order that all introduction of disease may be prevented.

MILITARY ORDERS, religious associations which arose from a mixture of the religious enthusiasm and the chivalrous love of arms which almost equally formed the characteristics of mediæval society. The first origin of such associations may be traced to the necessities of the Christian residents of the Holy Land, in which the monks, whose first duty had been to serve the pilgrims in the hospital at Jerusalem, were compelled, by the necessity of self-defense, to assume the character of soldiers as well as of monks. See JOHN (ST.), KNIGHTS OF. The order of the templars (q.v.) was of similar origin. Those of Alcantara and Calatrava in Spain had for their immediate object the defense of their country against the Moors. These orders, as well as that of Avis in Portugal, which was instituted with a similar view, followed the Cistercian rule, and all three differed from the templars and the knights of St. John in being permitted by their institute to marry once. The same privilege was enjoyed in the Savoyard order of knights of St. Maurice and the Flemish order of St. Hubert. On the contrary, the Teutonic knights, who had their origin in the crusades (See GRAND MASTER), were bound by an absolute vow of chastity. With the varying conditions of society, these religious associations have at various times been abolished or fallen into disuse; but most of them still subsist in the form of orders of knighthood, and in some of them attempts have recently been made to revive, with certain modifications, the monastic character which they originally possessed.

MILITARY PUNISHMENTS, those which are inflicted upon soldiers regularly enlisted, or non-commissioned or commissioned officers, for infractions of discipline or breaches of military law. Among the ancient Greeks the commander of an army was empowered, in case of sedition or mutiny, to cause the ringleaders to be seized and instantly put to death. Thus, we read in the *Iliad* that Agamemnon threatened deserters with death; and Alexander the great, when a mutiny took place partly in consequence of the jealousy excited by the favor which he showed the Persians, caused thirteen of his Macedonians to be executed without a trial. The military law of Athens prescribed the punishment of death for the crime of desertion while on service. Among the Lacedæmonians, cowards and deserters were either put to death or publicly disgraced; offenders who did not suffer the extreme penalty were made, when at home, to wear a parti-colored dress, and were obliged to submit in silence to any insult which the meanest citizen would like to offer. Disgrace was also attached to any soldier who had the misfortune to lose his shield. Said the Spartan mother to her son, "Return, my son, with your shield, or upon it." The ancient Romans punished crimes committed by the soldiery with great severity. For the gravest offenses they were beheaded or crucified; and under the Pagan emperors, some were burned alive, while others were exposed to wild beasts; but this may have been in the cases of those who professed the Christian religion. On the occurrence of a mutiny, every tenth, twentieth, or hundredth man engaged in it was selected for punishment; though sometimes only the ringleaders were chosen. Frequently, in the case of deserters or seditious persons, they were first scourged and afterwards sold into slavery; and sometimes such an offender was condemned to lose his right hand, or was bled nearly to death. If a soldier absented himself from his post when doing guard duty, he was examined by the tribune, and on the offense being proved against him was sentenced to the bastinado. Sometimes the culprit was permitted to escape, if able, while a shower of blows was being visited upon him; but in such instances he became an outcast, whom no one dare harbor. Punishments for theft, or for giving false testimony, and slight breaches of discipline, were lighter, though frequently of a similar character. Sometimes the culprit was temporarily deprived of his pay, forfeited his arms, or was degraded in rank. Again, he was sentenced to remain outside the camp, subject to the danger of being captured by the enemy; or he was made to stand in the prætorium exposed in an unmilitary dress. Or he was sentenced to a period of hard labor, reduced to an inferior rank, or dismissed the service in disgrace. Cowardice, or loss of arms, always subjected the Roman soldier to punishment. A centurion who committed a breach of discipline was condemned to surrender his emblem of authority, a vine branch. The power of life and death rested in the hands of a dictator, who could sentence to death any offender against military regulations; and the Roman consuls had the power of exercising summary jurisdiction in capital cases. Punishments were ordered by the legionary tribunes and by the prefects, with the concurrence of a council. The Roman system of punishments continued in vogue among the nations of modern Europe, so far as military offenses were con-

cerned, until a recent date. Besides the infliction of a certain number of lashes with cords, soldiers convicted of theft, marauding, or any other breach of discipline not punishable with death, were sentenced to run the gauntlet [gauntelope, or ganglope; from gang, a passage, and the root "to run," found in elope]. For the execution of this sentence the regiment was drawn up in a double line, and each man being furnished with a small stick, generally of osier (except the grenadiers, who used their belts), the culprit, naked to the waist, was either marched slowly or allowed to run as fast as he could, according to circumstances, from the head to the rear extremity between the two lines, each man striking him as he passed along. In certain cases the offender was afterwards expelled from the regiment, and sometimes also from the town or district, with a charge never to appear there again under pain of death. The punishment of the knout in the Russian army is inflicted with a leathern strap or belt, having a wooden handle, and is applied on the naked back of the offender. Cavalry soldiers were formerly frequently punished by the *picket*, as it was called; this consisted in the man being made to hang by his hands from a beam during a certain time, a stake, with its upper end made sharp, being planted in the ground under him, so that, when from weariness he could no longer keep himself up, his foot was pierced with the stake; this kind of punishment has been long abolished. Confinement without light during a certain number of hours was, and still is, a frequent punishment for being absent without leave from parade, either on account of drunkenness or from any other cause. Formerly the pillory was a punishment awarded to offenses of this nature. Besides the punishments of death and transportation, which for great crimes are within the scope of military law in the British army, breaches of discipline are visited by temporary imprisonment, extra drills, extra guards, and the performance of fatigue duties; but punishments consisting of protracted periods of confinement to barracks accompanied by laborious employments, inflicted at the discretion of commanders of regiments, have been abolished for many years, not, however, before the most serious mortality in consequence had made it absolutely necessary. While an army is in the field, breaches of discipline must be punished promptly and with more than usual severity. It might be presumed that acts of treachery will seldom be committed; desertions to the enemy do, however, occasionally take place; but the more usual crime is quitting the ranks on a lawless expedition of plunder, generally accompanied by gross acts of outrage and often murder, against the defenseless people of an invaded or occupied country. In such cases, it is generally conceded that the offenders should be, and they usually are, shot or hanged on the spot. Even when the crime is less heinous, the well-being and perhaps the safety of an army may be periled in consequence of resentment excited among the surrounding inhabitants, and punishment should be swift and condign. In the presence of an enemy there can scarcely be a more serious offense than intoxication; miscarriage of an enterprise, and defeat, with the loss of numbers of gallant men in an action, may be the fatal consequences of indulgence under such circumstances. Whatever may be the defense in other instances, there can be none in this, and the punishment is therefore always immediate and without recourse. The punishment of the lash is one that is now given up by civilized nations. Formerly, and particularly in the British army, a terrible frequency in the use of this discipline could not but tend finally to the demoralization of the men. Gen. sir Charles Napier has stated that in the beginning of this century, when flogging was common, he had frequently seen from 600 to 1000 lashes given under sentence by merely regimental courts-martial; and in those days a man who had suffered a part of his sentence was often brought from the hospital, before his wounds were entirely healed, to receive the remainder. The power of public opinion proved so strong in England, and was so manifestly opposed to flogging in the army and navy, that it gradually fell into disuse, until a regulation issued in 1866 practically abolished it. By the existing law, a man has to be convicted of one disgraceful offense before he becomes liable to flogging for the next one, and fifty lashes is the extreme penalty; see FLOGGING. In the United States this practice does not exist. Punishment by military law is confined, except in the case of the death-penalty, when engaged in war, to imprisonment, expulsion from the service, and minor penalties.

MILITARY SCHOOLS, as regards the British army, are divisible into several classes. 1. Those for the education of officers already in the service; of these there are the staff college (q.v.) and the establishment at Chatham for training engineer officers. 2. Professional schools common to officers and men will be found under GUNNERY, SCHOOL OF, and MUSKETRY, SCHOOLS OF. 3. Schools for the professional education of candidates for commissions; for these reference should be made to MILITARY ACADEMY, ROYAL, and to SANDHURST MILITARY COLLEGE. 4. The schools for men in the ranks and for their children are described under SCHOOLS, REGIMENTAL; while the instruction provided for their sons or orphans is shown under MILITARY ASYLUM, ROYAL.

The military schools of foreign countries deserve considerable attention, especially those of France, where a military commission is one of the best scholastic prizes looked forward to. In France no attempt is made to impart general education at the military seminaries; a boy is required to have a thorough general knowledge before he can be admitted to these institutions. Being open to universal competition, and being the only channel—or nearly so—to the best employment under the state, the great military

schools, by the high standard required for them, give great impetus to general education throughout the empire and the lycées, or public schools, adapt their course of instruction to the anticipated competition. In the army, two-thirds of the line commissions and one-third of those for the scientific corps are given to non-commissioned officers, but very few of these rise beyond the rank of captain; the remaining commissions in the line and scientific corps, and all appointments to the staff, are given by competition, after a careful course of professional education. The candidates in open competition are placed according to merit either in the infantry school of St. Cyr or the celebrated Polytechnique; at both colleges they have the right, if they need it, to partial or entire state support. From the school of St. Cyr the more promising pupils pass to the staff school, and thence, after a thorough course, to the état majeur of the army; the remaining students pass as subalterns into the line. The pupils of the Polytechnique, which is entered after the age of 17 years, have annually about 160 valuable prizes open to them. The first 30 to 40 candidates usually select civil employment under the state, such as the "ponts et chaussées;" those next in merit choose the artillery and engineers, and pass through a technical course at the school of application. The remaining students either fail to qualify and leave the school, or have to content themselves with commissions in the line, subordinate situations in the government, civil or colonial service, or they retire into civil life altogether.

In actual service there are schools for the men, who are also taught trades and singing. The standard of education among French soldiers is far higher than among their English brethren, as the conscription draws the men from all classes of society.

The Prussian system of military education differs from that of France in that competition is but sparingly resorted to; and the object is to give a good general and professional education to all the officers, rather than a specially excellent training to a selected few. Aspirants for commissions must enter in the ranks, and within six months pass a good examination in general and liberal knowledge; if, however, the candidate has been educated in a cadet-house—which is a semi-military school for youths—and has passed properly out of it, this examination is dispensed with. After some further service, the aspirant goes for nine months to one of three "division schools," where he completes his professional education. If he pass the standard here required, he is eligible for the next vacancy, but cannot be commissioned unless the officers of the corps are willing to accept him as a comrade. The artillery and engineer schools do for those services what the division schools do for the line. The culmination of Prussian military education is the staff school, open to competition for all the officers of the army, and presenting the highest prizes in the profession. In all the schools, the candidates study at the expense of the state, or receive great auxiliary grants.

The Austrian system is very elaborate, and commences at an early age; boys intended for military service beginning their professional almost contemporaneously with their general education. There are schools for training for non-commissioned officers and for officers, and senior departments for imparting more extended instruction to both classes. Candidates for appointment as non-commissioned officers pass by competition through the lower houses, where they remain till 11 years old; the upper houses, which detain them till 15; and the school companies, whence, after actual apprenticeship to service, a few pupils pass to the academies for aspirants for commissions, and the others are drafted into the service as non-commissioned officers. For officers, boys are pledged to the service by their parents at the age of 11, when they are placed in cadet-schools; after which the state takes charge of them. At about 16 the boys pass, according to qualification, to the line or scientific-corps academies, and four years later into those services themselves. The young officer's chance of entering the staff school—and therefore the staff—depends upon his place at the final academic examination. The competition observed throughout the course of military education is said to impart great vigor to the tuition.

In the Italian army the system so nearly approaches that of France that a separate description is unnecessary. It need only be stated that the educational status of the Italian officers is considered high.

MILITARY SECRETARY, an officer on the personal staff of generals in high command. His duties are to conduct the correspondence of his chief, and to transact a great amount of confidential business which would dangerously occupy the time of the general himself. The military secretary to the officer commanding-in-chief at the war office receives £1500 per annum, and is usually a general officer. The military secretary to a commander-in-chief in the field is for the most part below that rank, and receives only the staff pay of £346 15s.; while to a general commanding a division only, an *assistant military secretary*, at £173 7s. 6d. per annum, is allowed. This staff pay is of course additional to the officer's regimental or unattached pay.

MILITARY TRAIN, formerly a highly important corps of the army, of which the function was to transport the provisions, ammunition, and all other matériel, together with the wounded in time of battle. It was formed after the Crimean war, on the dissolution of the land-transport corps (q.v.). It comprised six battalions, in all 1840 officers and men, and its annual cost for pay, etc., was about £71,000. The corps ranked after the royal engineers, and was classed as mounted infantry, the officers receiving

infantry rates and the men cavalry rates of pay. The commissions were purchasable, as in the line. The men were armed with carbine and sword, but rather for defensive than aggressive purposes. Attached to each battalion were 166 horses, with proportionate wagons and ambulances.

It is proper to observe that the military train constituted only the nucleus of a transport service for a large army, and that in time of war it would be expanded by the addition of thousands of horses or mules and the incorporation of many hundred drivers, etc. The advantage of possessing even a few men ready trained and capable of directing the movements of others was amply demonstrated by the failures of the Crimea in 1854 to 1856; so that parliament voted ungrudgingly the expense of this corps, although in time of peace it was comparatively without employment. The military train was disbanded in 1870, as being too military in its formation. Its functions were transferred to the transport section of the army service corps, a purely non-combatant organization.

MILITEL'LO, a city of Sicily, in the province of Catania, and 21 m. s.w. of the town of that name. Pop. '72, 9,978. It stands on a mountain in a somewhat unhealthy situation. In its vicinity there are important salt-lagoons.

MILITIA (Lat. *miles,* a soldier) has now the acquired meaning of the domestic force for the defense of a nation, as distinguished from the regular army, which can be employed at home or abroad in either aggressive or defensive operations. Every nation has a reserve, under its law military, upon which its defense would fall, on the discomfiture of the regular army; but the system differs in each country, and, with the exception perhaps of the United States during peace, none are formed on the model of the British militia.

The militia is a constitutional force raised under the sanction of parliament, in which the people—in theory, at least—wage their own bodies for the defense of their own soil, and in which they depute the sole leadership and command to the sovereign and the crown nominees. Organized by counties and cities, it is essentially a local force: the selection of candidates for first commissions by the lord-lieut. of the county connects it with the land, while the command of the sovereign effectually combines in it the interests of the three estates. Under the Anglo-Saxons all men were required to bear arms, as a sort of body-rent for the land they held; but no special organization being adopted, efficiency was rarely attained in the use of arms. This the nation found to its cost when the Danes overran it during Alfred's reign. That great king, to prevent a similar occurrence, established the militia or *fyrd,* making land the basis of numbers, but the family system that of discipline: so many families were a tything, ten tythings a hundred, and hundreds were united into county powers, each under its *heretoch,* dux, or duke. Each section of the community had not only to furnish its quota in time of war, but also to provide arms, keep them in repair, and to undergo so many days' training every year. This arrangement subsisted in more or less vigor until the conquest; then the feudal troops at first rendered the militia unnecessary; but it never ceased wholly to exist. When the crown began to contend with the Norman barons, it naturally found its most powerful instrument in reviving the Saxon militia, and the English yeomanry became thenceforth the fear of England's enemies, and a guarantee for the gradual enfranchisement of the people. Henry II. established "an assize of arms," at which every holder of land was bound to produce one or more men fully equipped, and capable of fighting in the national defense. The arms were annually inspected, and it was illegal to sell, lend, or pawn them. This annual assembly of the fyrd or militia is first recorded after the conquest in 1181; by the statute of Winchester in 1285 Edward I. revised the scale of arms for the several ranks. Further alterations to suit the advances in the art of war took place in 1558 (4 and 5 Ph. and M. c. 2). In 1604 James I. (1 Jac. c. 25) abolished the fyrd, and substituted "trained (commonly called train) bands," to the number of 160,000 men —a force partaking of the nature of militia and volunteers, but deficient in discipline and drill. During the civil war of Charles I. the train bands or militia mostly sided readily with the parliament. Up to this time the command had never by any law been definitely assigned to the crown or to any other body. After the restoration, the loyal parliament of Charles II. immediately reorganized the militia—essentially on its present footing—and declared as law that "the sole supreme government, command, and disposition of the militia is, and by the laws of England ever was, the undoubted right of his majesty and his royal predecessors." As, however, the crown from this time began to depend for its support upon a mercenary army, and as the local status of the militia officers must always render the militia a force dependent on parliamentary influence and ties, the militia was much neglected until 1757, when a large portion of the regular army being absent in the seven years' war, it was carefully organized for the defense of the kingdom. Several militia acts have been subsequently passed, but rather with a view to consolidating the militia laws of England, Scotland, and Ireland, and to effect minor changes necessary for the growth of the institution, than to remodel in any essential degree the constitution of the force. The acts under which the militia is now organized are the 42 Geo. III. c. 90 and 91; 49 Geo. III. c. 120; 15 and 16 Vict. c. 50; 17 and 18 Vict. c. 13, 105 and 106; 18 and 19 Vict. c. 57, 100, and 106; and 38 and 39 Vict. c. 69, consolidating previous acts. The present law stands thus: The sovereign appoints lords-lieut. of counties, who nominate to *first* commissions in their county regi-

ments. The general commanding in the military district commands the militia force through the colonels of the sub-districts in which the regiments respectively are.

The force to be provided by each county—known as its "quota"—is fixed by government in proportion to the population, etc. The numbers must be provided in some way. In practice they are raised by voluntary recruitment; but should volunteering fail, a levy by ballot would be made upon all the inhabitants of the locality between the ages of 18 and 35. The power of making this ballot always exists, and would have by law to be enforced but for the militia ballot suspension act, which, when the measure is unnecessary, is passed from year to year. Many classes are exempt from the ballot, as peers, soldiers, volunteers, yeomanry, resident members of universities, clergymen, parish schoolmasters, articled clerks, apprentices, seafaring men, crown employees, free watermen of the Thames; in England any poor man with more than one child born in wedlock; in Scotland any man with more than two lawful children, and not possessed of property to the value of £50; in Ireland any poor man not worth £10, or who does not pay £5 per annum for rent, and has more than three lawful children under the age of 14.

The militia are bound, when called upon by the crown, to assemble annually for any period not exceeding three months, for training purposes; and the government can embody the whole or part of the force at any national crisis. The regiments were embodied almost without exception during the Russian war of 1854–56, and to a considerable extent at the time of the Indian mutiny, 1857–59. The quota of the United Kingdom is 200,000 men, but not above two-thirds of that number can be considered as effective. They may not be sent out of the kingdom, except they volunteer, and then only by special permission of parliament. As a defensive or garrison force, setting free the regular army for aggressive operations, the militia is a most valuable institution; and in times of war it has ever been found an admirable training-school whence soldiers volunteer into the permanent forces.

A militia volunteer receives bounty, payable partly on joining and partly in installments after each training period. When out for training, or embodied for permanent duty, the officers and men receive the same pay as regular troops of corresponding arms of the service, and are under the mutiny act and articles of war, except that no punishment can extend to life or limb. The officers rank with, but junior to, their brethren of the regular army; the great distinction in appearance between regular and militia troops being that in the former the appointments are all of gold-lace, and in the latter of silver; the buttons being similarly distinguished. The force is divided into heavy, light, rifles, and Highland infantry, and into artillery, the latter being generally limited to coast counties, and being very highly esteemed by the authorities.

The celebrated local militia was instituted in England and Scotland in 1808, and suspended in 1816. It consisted of a force for each county six times as numerous as the proper militia quota, comprising, of course, many classes, which, from age or other circumstances, were ineligible for the militia. These troops could only be marched beyond their respective counties in the event of actual invasion. Their numbers reached, in 1811, to 213,000 men.

The cost of the militia for the year 1879–80 amounted to £1,239,650, the number of officers and men provided for being 137,556 (including permanent staff and militia reserve). As a constitutional precaution, the estimates were formerly prepared—at least nominally—by a committee of the house of commons; but as the check was of no real advantage, it was abolished by a resolution of the house in 1863, and thenceforward the minister of war includes the charge among the many services provided for in his department.

MILITIA (*ante*). The militia system of the United States arose from that jealousy of standing armies which has always characterized the Anglo-Saxon peoples. After the revolutionary war congress determined to limit the regular army to the actual requirements of immediate necessity, and supplement it by a state militia. The president is commander-in-chief of the militia of the several states, when called into the actual service of the United States. He has the power to call out these forces, by orders to any officers of the militia he may address, in case of invasion or rebellion against the authority of the United States. The militia may be required to serve for a period not exceeding nine months. The troops receive during this time the pay and rations of soldiers of the regular army, and the officers rank next after officers of the same grade in the regular service. The majority of the state constitutions require the passage of laws for the organization and equipment of their militia. The governor is the commander-in-chief, and subject to his orders are the necessary officers, chosen by various methods in the different states. It was customary for many years to have annual drill days for all the state troops, who were compelled to attend under penalty, but the laws providing for them have been repealed or fallen into disuse. Voluntary organizations are now formed, which select their own uniforms and the branch of the service they desire to be attached to. They receive small state bounties to perfect their drill and keep themselves in good condition for an emergency. These organizations form only a small part of the whole militia, but quite sufficient for the government in time of peace. The actual militia of the United States consists of these volunteer troops and all other

able-bodied male citizens of the age of 18 and under 45, with the exceptions provided by national and state laws, all of whom are subject to be summoned to perform military duty according to the laws of congress or of their respective states.

The state militia was often called out during the revolution, and the "whisky insurrection" of 1794 was put down by the militia of Pennsylvania, New Jersey, Maryland, and Virginia. During the war of 1812 disputes arose between the national and state authorities regarding the right of the president to determine whether the emergency had arisen which authorized his calling them out, the right to place them under officers of the president's appointment, and the right to march them beyond the limits of the state. The courts decided in favor of the president, and his right to decide whether the militia shall be summoned, and his right to place them under the command of a federal officer ranking their own officers is no longer disputed. During the civil war, the first call of the president for 75,000 men was principally filled by the militia, and the total number of volunteers, drafted men, and militia troops during the whole war was 2,690,401. There were 1,000,516 men in the field at the proclamation of peace, and of these soldiers about 978,000 were volunteers or drafted men.

MILK is an opaque white fluid secreted by the mammary glands of the females of the class *Mammalia*, after they have brought forth their young, and during the period in which their offspring are too immature to live upon ordinary food. It is devoid of odor, except for a short time after its extraction; is of a slightly sweet taste, most commonly of a slightly alkaline reaction (except in the *Carnivora*, in which it is acid); and its average specific gravity (in the case of human milk) is 1032.

When milk has been allowed to stand for some time, a thick, fatty, yellowish-white stratum (the cream) forms upon its surface. When this is removed, the fluid below (popularly known as "skim-milk") is found to be of greater specific gravity, and of a more bluish-white tint. Milk does not coagulate on boiling, but a membrane or film of coagulated caseine, containing fat corpuscles, forms upon its surface. If milk be allowed to stand for some days exposed to air at the ordinary temperature, it gradually begins to exhibit an increasing acid reaction, from the formation of lactic acid from the milk-sugar; while the caseine becoming coagulated by the action of the lactic acid, is separated in the form of "curds," and the fluid gradually assumes the form of a thickish pulp. The ordinary means of obtaining the caseine (which exists in solution in the milk) in the form of curds is by the addition of a piece of rennet (the dried stomach of the calf), which acts as powerfully as any acid. The curds thus separated form the basis of cheese, while the fluid portion left after their removal is known as the 'whey."

When examined under the microscope, the milk appears as a clear fluid, containing fat globules (the milk globules, as they are usually called) in suspension. They commonly vary from .0012 to .0018 of a line in diameter. They are each invested with a delicate coat of caseine, which prevents their running together. By *churning*, the surrounding envelopes become ruptured, and the contents are made to unite, forming *butter*. In addition to milk globules, colostrum globules (see COLOSTRUM), which are irregular conglomerations of very small fat globules, occur in the milk for the first three or four days after delivery.

The following table, which is based on the researches of Vernois and Becquerel, represents the density and composition of 1000 parts of milk in various animals:

	Density.	Water.	Solid Constituents.	Caseine and Extractive Matters.	Sugar.	Fat (Butter).	Salts.
Woman	1032.67	889.08	110.92	39.24	43.64	26.66	1 38
Cow	1033.38	864.06	135.94	55.19	38.03	36.12	6.64
Mare	1033.74	904.30	95.70	33.35	32.76	24.36	5.23
Ass	1034.57	890.12	109.88	35.65	50.46	18.53	5 24
Goat	1033.53	844.90	155.10	35.14	36.91	56.87	6.18
Ewe	1040.98	832.32	167.68	69.78	39.43	51.31	7.16
Bitch	1041.62	772.08	227.92	116.88	15.29	87.95	7.80

The actual caseine which in the preceding analyses is associated with the undefined group of substances termed *extractive matters*, ranges from 27 to 35 in 1000 parts of healthy human milk, while in the colostrum it amounts to 40; in the milk of the cow it is somewhat higher; while in that of the bitch, and probably of all carnivorous animals, it is more than trebled. It is found in the case of women that the quantity of the caseine increases with the free use of animal food, and diminishes upon vegetable diet.

The fatty matters range from 25 to 43 in 1000 parts of women's milk, while in cows' milk they average, according to Lehmann, 45; and in bitches' milk, rise to 110. These fatty matters, which collectively form butter, consist of an admixture of 68 per cent of margarine, 30 per cent of oleine, and 2 per cent of an admixture of fats, which, on saponification, yield butyric, caproic, caprylic, and capric acids. The milk which is last yielded is much richer in fat than that which is first drawn.

The sugar, or lactine, whose properties are described in the article SUGAR OF MILK, varies in human milk from 32 to 62 in 1000 parts, and in cows' milk from 34 to 43. The milk of bitches, when fed on a purely animal diet, often contains no traces of sugar; but if they are fed on vegetable or mixed food, a considerable quantity of sugar is found. The salts in women's milk range from 0.6 to 2.5 in 1000 parts, and in cows' milk from 3.5 to 8.5. That a peculiar selective power is exerted by the mammary gland, is shown by the following table, which shows the comparative analyses of the ashes of cows' milk and of cows' blood, each reckoned for 100 parts:

	Ash of Milk.	Ash of Blood.
Chloride of potassium	14.18	none
Chloride of sodium	4.74	38.82
Potash	23.46	11.44
Soda	6.96	29.09
Phosphoric acid	28.40	7.74
Lime	17.34	1.90
Magnesia	2.20	0.75

Why the potassium and sodium compounds stand in this inverse relation to one another in these two fluids, is not accurately known. The abundant supply of phosphoric acid, lime, and magnesia in the milk is doubtless for the purpose of building up the infant skeleton.

The milk is liable to tolerably regular changes at different periods of lactation; for example, the sugar is deficient during the first month, and is in excess from the eighth to the tenth month; the caseine is in excess during the first two months, and is most deficient between the tenth and eleventh month; the butter is considerably in excess during the first month, and slightly so for the next two months; while the salts are most abundant during the first month, but present no regular law of decrease. Hence, it will readily be seen that in the selection of a wet-nurse, one of the leading requirements should be that her milk should be of the same age as that of the mother's. Various medicines, as, for example, iodide of potassium, iodide of mercury, and quinine, have been detected in the milk, after being taken by the mother; and many cases are on record in which strong mental impressions, as fear or anger, acting on the mother, have so far poisoned the milk as to cause immediate convulsions in the infant.

The daily quantity of milk is dependent upon various conditions, such as bodily constitution, food, etc. Lampérierre determined the quantity of milk secreted in definite times by a large number of women, and found as a mean for each breast between 50 and 60 grammes (the gramme being 15.4 grains) in the course of two hours, assuming that the secretion continues at a uniform rate.

In those cases in which a wet-nurse cannot be obtained, it is expedient to modify cows' milk, so as to make it resemble that of women. The main differences are, that the former contains more caseine and less sugar and water than the latter. By exposing cows' milk to a gentle heat in a wide open vessel, we obtain a film of caseine which may be removed (more than once, if necessary); on then adding sugar (sugar of milk, if procurable) and water, we obtain a good imitation of the human secretion.

In the article on DIGESTION, the uses of the leading ingredients of the milk in relation to nutrition are sufficiently noticed. The milk of cows is extensively used as an article of diet both for healthy persons and invalids, and it enters largely into all hospital, prison, and workhouse dietaries. In patients with a tendency to consumption, or in whom that disease has already manifested itself in its early form, cream is often of great service, especially when the stomach cannot bear cod-liver oil.

The adulterations to which milk is often subjected are noticed in the article FOOD, and the instruments used for testing the purity of this fluid are briefly referred to in the article GALACTOMETER. Water is by far the commonest adulteration, and if it has been added in large quantity, the fraud may be detected by evaporating a small weighed quantity of the milk (say 500 grains) to dryness, and ascertaining whether the due proportion of solid constituents is left.

Various methods have been proposed for the preservation of milk for sea voyages, etc. Moore's essence of milk is prepared by the addition of a little sugar and the evaporation of the fluid at a temperature of 110°, to one-fourth of its bulk, when it is put in small tin cases, soldered down, steeped in boiling water for a time, and taken out to cool. This preparation keeps good for a long time. Blatchford's solidified milk is prepared by mixing 112 lbs. of milk with 28 lbs of white sugar and a little bicarbonate of soda. The mixture is evaporated under certain conditions till it assumes the form of a creamy powder, which is cooled, weighed into parcels of 1 lb. each, and compressed into brick-shaped masses, which must be triturated and mixed with warm water when required for use. Grimwade's desiccated milk is prepared by mixing the fluid with a little sugar and alkali, and evaporating it till it is as thick as dough; it is then dried, crushed, and bottled. At the meeting of the British association in 1859, the abbé Moigno described four methods employed in France for the preservation of milk, of which the most valuable seemed those of Maber and De Pierre. For details regarding these methods, we must refer to the abbé's paper. He found milk prepared by Maber's process perfectly good after having been kept between five and six years. The milk pre-

pared by De Pierre's process, unlike the other preparation, is liquid. A specimen of it, the age of which was not stated, which the abbé brought to Aberdeen, was found to be perfectly fresh. The preparation of condensed milk is now conducted on a large scale in Switzerland.

MILK-FEVER, in the lower animals, comes on within a few days after puritiontar. One variety common to most animals consists in inflammation of the membranes of the womb and bowels, and is produced by exposure to cold, overdriving, or injury during labor; it is best treated by oil and laudanum, tincture of aconite, and hot fomentations to the belly. The other variety, almost peculiar to the cow, attacks animals in high condition, that are good milkers, and have already borne several calves; it consists in congestion and inflammation of the brain and large nervous centers, and impairs all the vital functions, leading to dullness, loss of sensation and motion, and stupor. Blood must be drawn early, whilst the cow is still standing and sensible. Later, it only hastens death. A large dose of physic, such as a pound each of salts and treacle, a dram of calomel, an ounce of gamboge, and 2 ounces of ginger, should at once be given, solid food withheld, clysters of soap, salt, and water thrown up every hour, cloths wrung out of boiling water applied along the spine, the teats drawn several times daily, and the animal frequently turned. Although treatment is uncertain, prevention is easily insured by milking the cow regularly for 10 days before calving, feeding sparingly on laxative unstimulating food, giving several doses of physic before, and one immediately after calving, and when the animal is in very high condition and prone to milk-fever, bleeding her a day or two before calving.

MILK-FEVER (*ante*), the fever which accompanies or precedes the secretion of milk in women recently delivered. The most common time of its appearance is about the third day after parturition, the symptoms being a quick pulse, increased heat, redness of the face, a diminution or temporary suspension of the lochial discharge, and swelling of the breasts, with a feeling of tension and oppression. There is a tendency to this condition in all women, and perhaps it may be regarded as a normal one, as it is difficult to suppose that so important a phenomenon as the establishment of the secretion of milk could take place without a certain degree of constitutional disturbance, and without there being any real pathological state of any of the organs. There are women, however, who suffer but little constitutional disturbance, comparatively. Those who suffer the most, among healthy women, are the plethoric and robust, and those whose minds are much occupied. Those who are subjects of chronic diseases will be affected in various ways, and no rules of prognosis can be relied on. The natural tendency is for the symptoms to pass away without any special treatment, but a judicious diet of bland articles, with the administration, when indicated, of salines and mild laxatives should not be disregarded.

MILL. This word is now used in a general way as a name for almost all kinds of manufactories, as well as for grinding-machinery; but we shall only describe here the arrangements of an ordinary flour-mill, adding a brief notice of the edge-mill in use for grinding oil-seeds and some other substances.

From time immemorial corn has been ground by a pair of stones. The earliest and rudest handmills were no doubt somewhat like one sent home by Dr. Livingstone, the African traveler, from the banks of the Shire in South Africa. He describes it as "a mill such as Sarah used, when told by her lord to do the thing handsomely and in a hurry for the strangers—i. e., a big stone worn hollow by the operations of grinding. The upper stone is grasped by both hands, and the weight of the body brought down on it as it is shoved to the lower part. . . . . The meal is made very fine." The next step in advance of this was the quern or handmill still in use in the Shetland isles, the Faröes, and other places. The old quern scarcely differs from a pair of modern millstones, except in the stones being small enough to allow of the upper one being turned by the hand instead of by wind, water, or steam power.

The millstones which are now all but universally used for grinding corn are made from buhr-stone, a form of silica like flint in hardness, but not so brittle. This rock is only found in abundance in the mineral basin of Paris and some adjoining districts, and belongs to the tertiary formation. It is of a cellular texture, and is frequently full of silicified shells and other fossils. Millstones are usually from 4 to 6 ft. in diameter, and are each made up of a number of pieces strongly cemented and bound together with iron hoops. One 6 ft. in diameter, of fine quality, will cost about £50. The grinding surface of each stone is furrowed or grooved, the grooves being cut perpendicularly on the one side, and with a slope on the other. A pair of stones are used together, and

both being furrowed exactly alike, the sharp edges of the grooves on the one come against those on the other, and so cut the grain to pieces.

Fig. 1 shows a section of a flour-mill reduced to its simplest elements. The millstones are at *a*, the lower of which is firmly fixed, it being a matter of importance to have this done securely; and the upper is made to revolve, on a shaft which passes up through the lower one, at a speed of one hundred revolutions per minute, more or less. Motion is communicated by the spur-wheel *b*, which is driven by a water-wheel or other power. The corn, previously cleaned, is supplied to the millstones by means of the hopper *c*, connected with which there is a valve, *d*, for regulating the supply. Passing through a hole in the center of the upper millstone, it comes in between the two, where it is ground, and thrown out on all sides by means of the centrifugal force. The millstones are, of course, inclosed, and the flour passes down through the spout *e*, to the worm at *f*, which, while it cools the ground corn, carries it along to elevators *g*. These raise it up to the floor on which the silk dressing-machine, *h*, is placed. This is a cylinder, which was formerly made of wire-cloth of various degrees of fineness, and consequently separated the flour into different qualities—the finest passing through the first portion, the second passing throught the next, and so on; but no part of it large enough in the openings to let through the bran, which passed out at the end. Silk is now preferred to wire-cloth for dressing the flour. Hoppers, *i*, are placed below the dressing-machine, by means of which the flour and bran are filled into sacks; No. 1 being fine flour; No. 2, seconds; and No. 3, bran.

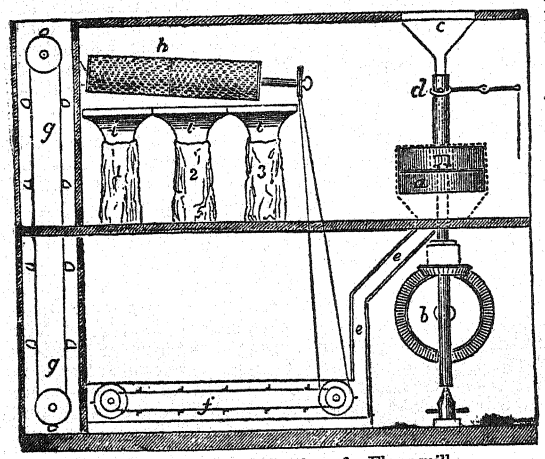

Fig. 1.—Elementary Section of a Flour-mill.

One of the largest flour-mills in Great Britain is the one belonging to Messrs. Tod at Leith. It is about 150 feet long, 50 feet broad, and 65 feet high. At one end of it is placed a steam-engine of 350 horse-power, which works all the machinery of the mill. This communicates motion to a series of shafts and wheels occupying the ground-floor, belts being used as much as possible for driving the wheels instead of spur gear, so as to avoid a shaking motion. On the second floor are placed 36 pairs of millstones, arranged in two lines along the room, the wheat being supplied silently to them by centrifugal feeders. On the third floor are situated the hoppers for feeding the millstones. The fourth floor contains iron rollers for partially crushing the wheat before being supplied to the millstones. This floor also contains silk and wire dressing-machines. On the fifth floor are placed the first silk dressing-machine, and also smut-machines for cleaning the wheat previous to grinding, which are somewhat similar to thrashing-machines. The sixth and highest floor also contains smut-machines. All these machines are connected in the most skillful manner by means of elevators ascending through all the floors; and along each, where necessary, there runs, in a horizontal direction, an archimedean screw, so that the grain or the flour can be conveyed to any of the machines without the assistance of hand-labor.

This mill converts wheat into flour at the rate of about 500 sacks a day of 24 hours—a quantity nearly sufficient to supply bread for the entire population of a city like Edinburgh. [The above description applies to Messrs. Tod's mill as it stood in 1863. It was subsequently greatly extended; and, after being destroyed by fire in 1874, has been completely refitted.] The great government mill of St. Maur is the most remarkable mill in France.

There is a form of mill in use for some purposes where the millstones are vertical, and called the edge-stone mill. It is sometimes, though rarely, used for grinding corn; but is much employed for crushing oil-seeds and for grinding dye-stuffs, sugar, chemicals, and a multitude of other substances. The stones are generally of some hard rock, such as granite or sandstone, and from 5 to 7 feet in diameter. For such purposes as grinding clay or loam they are usually made of cast iron, and of a smaller size. The stones revolve in opposite directions, sometimes upon a fixed stone or metal bed, and at other times it is the bed-plate itself which revolves, and in so doing turns the edge stones which rest upon it.

Among the recent improvements in our flour-mills which have attracted considerable attention are: 1. The patent process of dressing the grinding surface of the millstones by means of a peculiar kind of diamond, which rapidly covers it with fine grooves. This is still, however, more largely, and perhaps more efficiently, done by the slower process with

the nidging hammer; 2. The keeping down of the temperature of the millstones by means of a current of cold air; and 3. The introduction of Carr's patent disintegrater, which grinds wheat and other substances by means of two vertical iron disks about five feet in diameter, and a few inches apart, in each of which are several concentric rows of steel pegs, so arranged that those on the one disk overlap without touching those on the other. The disks are made to revolve rapidly in opposite directions, so as to grind the wheat by percussion.

MILL, in law. The owner of a mill situated on the bank of a stream is entitled to have the use of the stream undiminished in volume; and if the other riparian owners above interfere with the stream by diminishing its volume, thereby causing injury to the mill, the mill-owner has a right of action against the party so acting.

MILL, JAMES, was the son of a small farmer, and was b. in the neighborhood of Montrose, Scotland, April 6, 1773. He studied, with a view to the church, at the university of Edinburgh, where he distinguished himself in Greek and in moral and metaphysical philosophy. He was licensed to preach in 1798; but instead of following out the ministry, he went to London in 1800, where he settled as a literary man. He became editor of the *Literary Journal*, which after a time was discontinued; and wrote for various periodicals, including the *Eclectic* and the *Edinburgh Review*. In 1806 he commenced his *History of British India*, which he carried on along with other literary work, and published in the winter of 1817–18. The impression produced by this masterly history on the Indian authorities was such that, in 1819, the court of directors of the company appointed him to the high post of assistant-examiner of Indian correspondence, notwithstanding the then unpopularity of his well-known radical opinions. The business assigned to his care was the revenue department, which he continued to superintend till four years before his death, when he was appointed head of the examiner's office, where he had the control of all the departments of Indian administration—political, judicial, and financial—managed by the secret committee of the court of directors. Shortly after his appointment to the India House he contributed the articles on government, education, jurisprudence, law of nations, liberty of the press, colonies, and prison discipline to the *Encyclopædia Britannica*. These essays were reprinted in a separate form, and became widely known. The powers of analysis, of clear statement, and of the thorough-going application of principles, exhibited in these articles had probably never before been brought to bear on that class of subjects. In 1821–22 he published his *Elements of Political Economy*, a work prepared primarily with a view to the education of his eldest son, John Stuart Mill. In 1829 his *Analysis of the Human Mind*, appeared. His last published book was the *Fragment on Mackintosh*, brought out in 1835. He was also a contributor to the *Westminster Review* and to the *London Review*, which merged in the *London and Westminster*.

Not long after he settled in London he made the acquaintance of Jeremy Bentham, and for a number of years lived during the summer in Bentham's country-house. Although he must have derived much benefit from his intercourse with the great law-reformer, he was not a mere disciple of Bentham, but a man of profound and original thought, as well as of great reading, in all the departments of moral, mental, and political philosophy. His conversation was impressive to a remarkable degree, and he gave a powerful intellectual stimulus to a number of young men, some of whom (including his own son and Mr. Grote, the historian of Greece) have since risen to eminence. He took a leading part in the founding of University college, London. He died at Kensington, June 23, 1836. See Autobiography of J. S. Mill, and an interesting Biography by prof. Bain in *Mind*, 1876–78.

MILL, JOHN, 1645–1707; b. Shapp, Westmoreland, Eng.; graduated at Queen's college, Oxford, in 1669; was soon after elected a fellow and became eminent as a tutor; entered the ministry, and became distinguished as a preacher; became rector in 1681 of Blechington, Oxfordshire; was made chaplain to Charles II., and received the degree of D.D., the same year. In 1685 he was made principal of St. Edmund's hall; in 1704, by queen Anne, prebendary of Canterbury. The work for which he is the most distinguished is his new edition of the Greek Testament, on which he spent 30 years, finishing it only 14 days before his death. It was undertaken at the advice and expense of Dr. Fell, bishop of Oxford, but after the bishop's death Mill continued it at his own expense, and repaid to the executors what he had received. It was published the year that he died. The text which Mill adopts is that of Robert Stephens of 1550, and contains 30,000 various readings collected from manuscripts, commentaries, writings of the fathers, etc. Dr. Whitby attacked the work in his *Examen variantum lectionum Joh. Millii;* but Dr. Bentley approved the labors of Mill, and Michaelis, Marsh, and other critical scholars acknowledged the value of the edition. It was taken up for a different purpose by Antony Collins in his discourse on *Free Thinking*, in which he contends that "these numerous variations destroy the authority of the New Testament," a book which was ably answered by Whiston and Bentley who show that the variety of readings is only the necessary result of the number and variety of manuscripts. Mill's text has long been held in high esteem by scholars.

MILL, JOHN STUART, was b. in London May 20, 1806. He was educated at home by his father. In 1820 he went to France, where he lived for upwards of a year, making

himself master of the French language, and occasionally attending public lectures on science. He lived for some time at Paris, in the house of the French economist Jean Baptiste Say, where he made the acquaintance of many men distinguished, then or afterwards, in letters and in politics. He spent part of his time in the s. of France, in the house of sir Samuel Bentham, brother to Jeremy Bentham. During this stay in France he laid the foundation of his great familiarity with, and interest in, the politics as well as the literature of the French nation. In 1823 he entered the India House, and became a clerk in the examiner's office, where his father was assistant examiner. For thirty-three years he continued to be occupied in the department of the office named the political, or the transactions of the company with the native states. In 1831 he was appointed assistant examiner, and in 1856 he was placed at the head of the department. He energetically opposed the transfer of the India government to the crown in 1858. On the score of failing health he declined a seat at the new Indian council, and retired from office in October of the same year, on a compensating allowance. At the general election of 1865 Mill was returned to parliament for Westminster; and till he lost his seat at the election of 1868 he acted with the advanced liberals. He died May 8, 1873, at Avignon, where he had spent most part of the last years of his life.

Mr. Mill became an author at a very early age, and may be looked upon as one of the foremost thinkers of his time. His first publications consisted of articles in the *Westminster Review*. He took an active part in the political discussions that followed the revolution of 1830 in France and the reform-bill movement in England; and from 1835 to 1840 was editor, and along with sir W. Molesworth proprietor, of the *London and Westminster Review*, where many articles of his own appeared. In 1843 he published his *System of Logic;* in 1844, *Essays on some Unsettled Questions of Political Economy;* in 1848, *Principles of Political Economy;* in 1859, an essay on *Liberty;* in 1860, *Discussions and Dissertations;* in 1863, a small work on *Utilitarianism;* in 1865, *Comte and Positivism* and the *Examination of Sir William Hamilton's Philosophy;* in 1867 (when Mill was rector of St. Andrew's university), his *Inaugural Address;* in 1868, *England and Ireland;* and in 1869, *The Subjection of Women*. After his death apppeared his *Autobiography* (1873), read with intense interest; *Three Essays on Religion* (1874); and a second volume of *Discussions and Dissertations* (1875).

MILLAIS, JOHN EVERETT, R.A., a celebrated English painter, was b. at Southampton in 1829, entered the royal academy at the age of eleven, and in 1847 carried off the gold medal for his picture of "The Tribes of Benjamin seizing the Daughters of Shiloh," exhibited, in the following year, at the British institution. Before this period he had acquired a considerable reputation among younger painters by his avowed antipathy to the principles of art which then prevailed. His views were shared in by other students, such as Holman Hunt (q.v.), Dante Rossetti (q.v.), and Charles Collins, and a sort of artistic fraternity was formed, which obtained the name of the *Pre-Raphaelite School*. Millais's principal paintings are: "Our Savior" (1850); "Mariana in the Moated Grange" (1851); "The Huguenot" and "Ophelia" (1852); "The Order of Release" and "The Proscribed Royalist" (1853); "The Rescue" (1855); "Autumn Leaves" (1856); "The Heretic" (1858); "Spring Flowers" (1860); "The Black Brunswicker" (1861); "My First Sermon" (1863); "My Second Sermon" (1864); "Joan of Arc" (1865); "Sleeping," "Waking," "Jephtha" (1867); "Moses" (1871); "Chill October" (1871); "Day Dreams" (1874); "Sound of Many Waters" (1877), etc. Whatever opinions may be held of Millais as an *artist*, no respectable critic denies the subtlety of his imagination and depth of sentiment. He is profoundly poetical, and has probably never been surpassed in representing intense feeling and thought by means of color and composition; but his perverse affectation and contempt for "conventionalism" have marred his finest productions.

MILLARD, a co. in w. central Utah, bordering on Nevada. It is drained by the Sevier river, flowing into the lake of the same name, which is found in the central part of the co., and which has no visible outlet; pop. '70, 2,753—1,974 of American birth. Though of large area—160 m. in length and 65 m. wide—the greater part of the surface is either mountainous or a barren desert. Some small sections are fertile, and here Indian corn and wheat are raised. Chief town, Fillmore City.

MILLARD, DAVID, 1794–1873; b. N. Y.; was the son of a revolutionary officer, and spent his early life in farming. His education was entirely self-acquired. He studied theology, and in 1818 became pastor of a church in West Bloomfield, N. Y., where he remained until 1832. He then edited the *Gospel Luminary*, a religious monthly, and in 1837 settled in Portsmouth, N. H. He occupied for several years the professorship of biblical antiquities and sacred geography in the Unitarian theological school at Meadville, Penn.; and published *The True Messiah in Scripture Light* and *Travels in Egypt, Arabia, Petræa, and the Holy Land*. His life was published in 1874 by his son, Rev. D. E. Millard.

MILLAU, or MILLAUD. See MILHAU, *ante*.

MILLBURY, a t. in Worcester co., Mass., 6 m. s. of Worcester, 37 m. n.w. of Providence, on the Blackstone river, the Providence and Worcester, and the Millbury branch of the Boston and Albany railroads; pop. '70, 4,529. The chief business is the manufac

ture of cottons and woolens. There are also boot and shoe, whip, carriage, stocking, and cutlery factories, and machine-shops.

MILLEDGE, JOHN, 1757–1818; b. Ga.; was an active supporter of the revolutionary cause, being one of Habersham's party which made a prisoner of gov. Wright of Georgia—the first act of open revolt in that state. At the capture of Savannah, Milledge escaped and was present at its siege by the colonial forces under gen. Lincoln. In many other scenes of the revolution he played a prominent and gallant part, but before the close of the war was asked to take the position of attorney-general, which he did in 1780. He served nine times as the representative of Georgia in congress; from 1802 to 1804 was governor of the state, and filled a short term as U. S. senator, 1806–9. The town of Milledgeville, in Baldwin county, formerly the capital of the state, was named after him. To the establishment of the state university and its seat, Athens, he contributed liberally, and was in fact the founder of both town and college.

MILLEDGEVILLE, the former capital of Georgia, U. S., on the w. bank of the Oconee river, 150 m. n.w. of Savannah, in a rich cotton country. Among its edifices are the former governor's residence and state buildings, and several churches. Pop. '70, 2,750.

MIL'LEDOLER, PHILIP, D.D., 1775–1852; b. Rhinebeck, N. Y. His father emigrated from Bern, Switzerland, to America about 1751. Philip graduated in 1793 at Columbia college; studied theology, and was licensed to preach at the age of nineteen; became pastor of the German Reformed church, Nassau street New York, in 1795, preaching in German and English. His eloquence drew large audiences. In 1800 he was called to the Third, or Pine street Presbyterian church, in Philadelphia. In 1805 he accepted the pastorate of the Presbyterian church in Rutger street New York. In 1813 he transferred his relations to the Reformed church, and became pastor of the Collegiate Dutch church in New York. In 1825 he was elected professor of polemic and didactic theology in the seminary at New Brunswick, N. J., at the same time president of Rutgers college, and professor of moral philosophy; which offices he retained until 1841, when he retired to private life. He declined several offers of high position in the church. He was one of the founders of the American Bible society. Dr. Milledoler was a man of great unction and power in the pulpit, and uncommonly gifted in the conduct of public prayer.

MILLE LACS, a co. in e. central Minnesota, bounded on the n. by lakes of the same name; drained by Rum river; 570 sq.m.; pop. '80, 1501—242 of foreign birth. The surface is undulating, and mostly covered with forests. Wheat, corn, and hay are raised, but the chief industry is in getting out and sawing lumber. Chief town, Princeton.

MILLENARIANS (MILLENNIUM, *ante*), in a general sense all who believe that Christianity will attain in the future a marked degree of prevalence through the world. Their faith in this rests on many prophetic descriptions and promises. But that the triumph will be for a limited period is founded on a declaration in the Apocalypse that Satan will be confined in the bottomless pit for a thousand years, and that during the same period the souls of the martyrs and others will live and reign with Christ. Some interpret this period literally; others think that the definite period is put for one indefinitely long; and a third class suppose that a day stands for a year, and consequently that an exceedingly long period is marked out. But while these differences of opinion are found among the general class, a more radical difference divides modern millenarians into two great classes: the one affirming that the period of a thousand years will be introduced by and follow the second visible coming of Christ; the other declaring that the second coming will be after the millennium, and will introduce the end of the world. The first are called strictly premillenarians but in popular usage the title millenarians is almost entirely restricted to them. They hold that the second coming of Christ will be in order to reign visibly on the earth to subdue the obstacles that now restrict the extension of his kingdom, and to destroy the personal enemies of it and of himself. And simultaneously with his coming they believe there is to be a resurrection of a part or of the whole of those who have died in Christ, but that the resurrection of the remainder of mankind will not take place until the end of the world. This point is of vital importance to their whole system. If it be true, much that they teach with it must be admitted; if it be false, the whole system falls to the ground. Their belief in the first partial resurrection rests on three passages of Scripture. The first is: 1. Thess. iv. 16, "The dead in Christ shall rise first." Here, they argue, the distinction drawn is between the dead who are Christians and those who are not; and it is declared that the Christians shall rise first. But to this those who hold the contrary opinion reply that the distinction which the apostle draws is between two classes of Christians—those who have died or will die before the coming of the Lord, and those who then will be living on the earth. The latter, he affirms, shall not prevent (shall not have any priority or advantage over) their brethren who are dead; but that at the coming of the Lord first the dead in Christ will rise, and afterwards those who remain alive shall together with them be caught up to meet the Lord in the air. In this passage, therefore, those who are not premillenarians find no intimation that one portion of the dead will rise before other portions. The second passage, supposed by some to teach that the resurrection of Christians

will precede that of other men, is 1. Cor. xv. 22–24, "For as in Adam all die, even so in Christ shall all be made alive. But every man in his own order: Christ the firstfruits; afterwards they that are Christ's at his coming. Then cometh the end, when he shall have delivered up the kingdom to God." Here, premillenarians say, it is taught that the resurrection takes place in the following order: (1) That of Christ. (2) That of his people. (3) That of other men. And, as between the resurrection of Christ and that of his people a long interval is placed, so there may be a period of less or greater extent between the resurrection of believers and that of unbelievers. To this the other side reply that Paul speaks throughout the passage only of the resurrection of believers. This some among the Corinthians denied, and this, therefore, he undertook to prove, making no reference to the resurrection of other men, knowing that the one sufficiently involved the other. And the "end" of which he speaks, refers, they say, not to the resurrection, but to the completion of the work of redemption, when Christ shall have put down all opposing rule, authority, and power. But the passage which apparently favors the pre-millenarian view most strongly, and without which the others probably would not be supposed to have much force, is Rev. xx. 4–6: "I saw the souls of them that were beheaded for the witness of Jesus, and for the word of God, and which had not worshiped the beast, neither had received his mark upon their foreheads, or in their hands; and they lived and reigned with Christ a thousand years. But the rest of the dead lived not again until the thousand years were finished, This is the first resurrection. Blessed and holy is he that hath part in the first resurrection; on such the second death hath no power, but they shall be priests of God and of Christ, and shall reign with him a thousand years." Premillenarians, interpreting this passage literally, regard it as teaching that a thousand years before the end of the world, when Christ shall come to reign visibly on the earth, there will be a resurrection of Christians from their graves to dwell here, and share with Christ the glories of his reign. To this those on the other side reply that the passage is to be understood not literally, but as a symbolic representation of the actual event. At the beginning of the book it is said that God *signified* the revelation to his servant John; that is, represented it by signs or symbols. Accordingly, the book contains a succession of symbols in which the actual meaning is set forth with striking impressiveness. There are 7 stars, 7 golden lamps, 4 horses and their riders; and so on through the book. Some of them are interpreted, e.g., the stars, the lamps, and the golden censer; others the reader is left to study out for himself. At the beginning of chap. xx. there are two principal symbols employed. 1. The binding of Satan in which the bottomless pit, the key, the chain, are symbols of the suppression of Satan's power over the souls of men. 2. John says that he saw certain classes of souls, that he describes, and that they lived and reigned with Christ a thousand years. That which he saw was—as those who argue against a literal resurrection think—a symbol of the actual event intended to be foretold, viz. the zeal for Christ that his disciples would display. This would be so remarkable that the souls of martyrs would be an appropriate symbol of it; a symbol worthy to be ranked among those employed in this book of revelation. Tried even by this high standard, what symbol, it is asked, could be more significant of devoted zeal than that here employed? How could the piety of a man be more highly commended than to say he has the soul of a martyr? What could be said more expressive of power in a church than that all its members manifest the spirit of those who had forfeited their lives for the testimony of Jesus? How could irresistible power in Christendom be more strikingly expressed than by saying that nowhere or by no person is any other spirit manifested than the spirit of martyrs. Yet, according to this interpretation, John says this will be the case in the millennium. "The rest of the dead lived not again until the thousand years were fulfilled." There will be none like them in all that time. The souls of the wicked, of the worldly, of double minded, half-hearted, or timid Christians, are not an appropriate symbol of Christians in millennium times. And these devoted ones, it is added, shall reign with Christ during the thousand years. They shall not only be devoted to him, but also happy with him. The martyr's zeal will be united with the prosperity of triumphant times. The symbol having been given, the interpretation is added: "This is the first resurrection." That is, the new life of the soul which comes with faith in Christ. This is experienced before the resurrection of the body, and is therefore called the first resurrection. The Savior foretold both together, and placed this first. "The hour is coming, and now is, when the dead shall hear the voice of the Son of God, and they that hear shall live." This describes the resurrection of the soul which was even then taking place. After that comes the description of the general resurrection—even of all that are in the graves. And all through the epistles this resurrection of the soul is affirmed, and its importance is magnified as by the power of Christ, the source of all the life of Christianity in the church. This, therefore, is actually "the first resurrection," separated from the general resurrection by the whole period between the first preaching of the gospel and the last day. And besides this, those who are not premillenarians say there is nothing else foretold in Scripture to which the name, first resurrection, is to be applied. It is probable that neither of these interpretations is found satisfactory in every point by the great mass of the nominal adherents to either view. On each side a few leaders are enthusiastically sure; but the common Christian feeling is that in each view there is some strength and much weakness; that while the strict premillennial view from a flat

literal interpretation of a few texts, tends to an externalism and a gross materialism in the handling of noble spiritual facts, the opposite and more usual view tends to dissolve all spiritual facts in a vast sea of symbolism, and this on a principle of interpretation by which any words in Scripture may be turned to almost any meaning. The usual expedient of seeking a view carefully limited between the two extremes and antagonizing both, seems scarcely feasible in this case. This is not the place to say more than that the truth will probably be found not between, but combining both—not so much rejecting either, as solvent and comprehensive of both in some higher range of thought.

MILLENNIUM (Lat. a thousand years' time) designates a certain period in the history of the world, lasting for a long indefinite space (vaguely a thousand years), during which the kingdom of Messiah will, according to tradition, be visibly established on the earth. The idea originated proximately in the Messianic expectations of the Jews; but more remotely, it has been conjectured, in the Zoroastrian doctrine of the final triumph of Ormuzd over Ahriman, and was connected by the Christians with the *Parousia*, or Second Coming of Christ. The notion of a golden age, preserved by the converts from heathenism to Christianity, as well as the oppression and persecutions to which they were long subjected by the state authorities, were naturally calculated to develop and strengthen such hopes. The chief basis of the millenarian idea in Judaism as well as in Christianity, however, is the ardent hope for a visible divine rule upon earth, and the identification of the church with that of which it is merely a symbol. In the 1st c. of the church, millenarianism (the Greek equivalent of which, *chiliasm*, from *chilioi*, a thousand, is the term employed by the fathers) was a widespread belief, to which the book of Daniel, and more particularly the pictorial predictions of the Apocalypse (chaps. xx. and xxi.), gave an apostolical authority; while certain prophetical writings, composed at the end of the 1st and the beginning of the 2d c.—such as the *Testament of the Twelve Patriarchs*, the *Fourth Book of Esdras*, the *Revelation of Saint Peter*, etc.; also the *Christian Sibylline Books*, the *Epistle of Barnabas*, the *Shepherd of the Pseudo-Hermas*, several Midrashim, Targums, and other works of a partly legendary character embodied in the *Talmud*—lent it a more vivid coloring and imagery. The unanimity which the early Christian teachers exhibit in regard to millenarianism, proves how strongly it had laid hold of the imagination of the church, to which, in this early stage, immortality and future rewards were to a great extent things of this world as yet. Not only the heretic Cerinthus, but even the orthodox doctors—such as Papias, bishop of Hierapolis, Irenæus, Justin Martyr, etc.—delighted themselves with dreams of the glory and magnificence of the millennial kingdom. The *Sibylline Books*, for instance, hold that the earth will be cultivated throughout its length and breadth, that there will be no more seas, no more winters, no more nights; everlasting wells will run honey, milk, and wine, etc., etc. Papias, in his collection of traditional sayings of Christ (*Kuriakōn Logiōn Exēgēseis*), indulges in the most monstrous representations of the rebuilding of Jerusalem, and the colossal vines and grapes of the millennial reign. Every vine will bear 10,000 branches, every branch 10,000 shoots, every shoot 10,000 sprigs every sprig 10,000 bunches, every bunch 10,000 berries, every berry 36 times 25 gallons of wine; and if a Saint come to pluck a berry, they will all cry out: "Pluck me, O Saint, I am better, and praise the Lord through me." The Talmud calculates the height of the men of the millennium to be, as before the fall, of 200—900 yards; the moon shall be, according to a prophetical dictum, like the sun; the sun shall be increased 343 times; and every Israelite will beget as many children as there were Israelites going out from Egypt—60,000. Each grape will be large enough to fill the biggest ship. Above all, however, the land of Israel will be free again, and the primitive worship restored with unheard-of splendor. "Such a chiliasm," Neander justly remarks, could only "promote a fleshly eudaimonism;" and indeed ere long it called into more energetic activity the opposition of Gnostic spiritualism. According to the general opinion, which was as much Christian as Jewish, the millennium was to be preceded by great calamities, reminding us in some degree of the Scandinavian ragnarök (or "Twilight of the Gods"). The personification of evil appeared in *Antichrist*, the precursor of Christ (identified, during 1st c., with Nero), who would provoke a frightful war in the land of Magog (Ezek. chaps. xxxviii. and xxxix.) against the people of Gog, after which the Messiah—some say a double Messiah, one the son of Joseph, vanquished in the strife; the other, the victorious son of David—would appear, heralded by Elias, or Moses, or Melchizedek, or Isaiah, or Jeremiah, and would bind Satan for a thousand years, annihilate the godless heathen, or make them slaves of the believers, overturn the Roman empire, from the ruins of which a new order of things would spring forth, in which the "dead in Christ" would arise, and along with the surviving saints enjoy an incomparable felicity in the city of the "New Jerusalem," which was expected to descend literally from heaven. To the innocence which was the state of man in Paradise, there was associated, in the prevalent notions of the millennium, the finest physical and intellectual pleasures.

In the Mosaic account of creation, we find the primitive ground for making the victorious era of the church last a thousand years. That account was regarded by the Jews and by the Judaic Christians as a type of the destinies of creation. Now, by a strictly literal interpretation of the 4th verse of the 90th Psalm, it was supposed that a day of God was arithmetically equal to a thousand years; hence the 6 days of creation were

understood to indicate that the earth would pass through 6,000 years of labor and suffering, to be followed by a 7th day—that is, 1000 years of rest and happiness. In the Book of Revelation (chap. xx.) this view is presented. Still, the rabbinical traditions differ widely among themselves as to the duration of the happy period. Instead of 1000 years, some of them count 40, 70, 90, 365, 400, 600, 2,000, or 7,000, or so many years as have elapsed from the creation of the world or the flood. The Gospel of Nicodemus makes it 500 years, etc. In fact, the systems of apocalyptic chronology were of a varied and somewhat arbitrary cast; according as their originators laid greater stress upon the Apocalypse, the Book of Daniel, the Song of Songs, the Jewish "Gematria," or Computation of Letters—a very pliable art in itself—or on astronomy, astrology, "natural phenomena," and the like.

The lapse of time chilling the ardor of the primitive Christian belief in the nearness of the *parousia* had without doubt also the tendency to give a more shadowy, and therefore a more spiritual aspect to the kingdom over which the expected Messiah was to reign. The influence of the Alexandrian philosophy contributed to produce the same result. Origen, for example, first started the idea that instead of a perpetual opposition of paganism to Christianity—instead of a final and desperate conflict between the two—instead of an insolent triumph on the part of the saints, and a servile submission on the part of the unbelievers, the real progress and victory of Christianity would consist in the gradual spread of the truth throughout the world, and in the voluntary homage paid to it by all secular powers. This was an immense advance on the views previously entertained. It is owing largely to Origen and his disciple Dionysius that more spiritual conceptions of the millennium finally established themselves in the church; at all events, they furnished the fathers with the majority of their arguments. Yet even in the Egypto-Alexandrian church, millenarianism, in its most literal form, was widely diffused, and was only eradicated by the great wisdom and moderation of Dionysius. The Montanists (q.v.) generally, as might be expected from the enthusiastic tendencies of the sect, were extreme millenarians or chiliasts, and, being considered a heretical sect, contributed largely to bring chiliasm into discredit, or, at all events, their own carnal form of chiliasm, which Tertullian himself attacked. Caius, the presbyter, in his "Disputation" against the Montanist Proclus, traces its origin to the hated heretic Cerinthus, whom he accuses of forging a certain revelation, which he passed of as the work of an apostle. From his description of this revelation it is almost certain—strange as it may appear—that he alludes to the canonical Apocalypse. Lactantius, in the beginning of the 4th c., was the last important church father who indulged in chiliastic dreams, while among its earlier advocates may be mentioned chiefly Nepos, Methodius, Korakion, Apollinarius, Victorinus, etc. In the 5th c. St. Jerome and St. Augustine expressly combated certain fanatics who still hoped for the advent of a millennial kingdom whose pleasures included those of the flesh. But from this time the church formally rejected millenarianism in its sensuous "visible" form, although the doctrine every now and then made its reappearance, especially as a general popular belief, in the most sudden and obstinate manner. Thus the expectation of the *last day* in the year 1000 A.D. re-invested the doctrine with a transitory importance; but it lost all credit again when the hopes, so keenly excited by the crusades, faded away before the stern reality of Saracenic success, and the predictions of the *Everlasting Gospel*, a work of Joachim de Floris, a Franciscan abbot (died 1212), remained unfulfilled.

At the period of the reformation, millenarianism once more experienced a partial revival, because it was not a difficult matter to apply some of its symbolism to the papacy. The pope, for example, was *Antichrist*—a belief still adhered to by some extreme Protestants. Yet the doctrine was not adopted by the great body of the reformers, but by some fanatical sects, such as the Anabaptists and by the Theosophists of the 17th century. During the civil and religious wars in France and England, when great excitement prevailed, it was also prominent. The *fifth monarchy men* of Cromwell's time were millenarians of the most exaggerated and dangerous sort. Their peculiar tenet was that the millennium *had* come, and that *they* were the saints who were to inherit the earth. The excesses of the French Roman Catholic Mystics and Quietists terminated in chiliastic views. Among the Protestants it was during the *thirty years' war* that the most enthusiastic and learned chiliasts flourished. These may—broadly—be brought under the three chief heads of *exegetical* chiliasts, who, by some biblical dates, endeavored to compute the predicted time; *alchemistic* or *cabalistic* chiliasts, who endeavored to hasten the period by some mystical discovery; and *politico-theocratic* chiliasts, who wished to reduce the governments of the world to a biblical standard. See ANABAPTISTS, MÜNZER. The awful suffering and wide-spread desolation of that time led pious hearts to solace themselves with the hope of a peaceful and glorious future. Since then the penchant which has sprung up for expounding the prophetical books of the Bible, and particularly the Apocalypse, with a view to present events has given the doctrine a faint semi-theological life, very different, however, from the earnest, practical faith of the first Christians. Among the foremost chiliastic teachers of modern centuries are to be mentioned Ezechiel Meth, Paul Felgenhauer, bishop Comenius (*Lux in Tenebris*, 1657); prof. Jurien (*L'Accomplissement des Prophéties*, 1686); Serarius (*Assertion du Regne de Mille Ans*, etc., ab. 1670); Poiret (*Economie Divine*, 1687); J. Mede (*Clav. Apocal.* 1627); while Thomas Burnet and W. Whiston endeavored to give chiliasm a geological foundation, but with-

out finding much favor. Spener, on account of his *Hoffnung besserer Zeiten*, has been accused of chiliasm; no less Joachim Lange (*Licht und Recht*); and Swedenborg employed apocalyptic images to set forth the transfigured world of the senses. Latterly, especially since the rise and extension of missionary enterprise, the opinion has obtained a wide currency that after the conversion of the whole world to Christianity, a blissful and glorious era will ensue; but not much stress—except by extreme literalists—is now laid on the nature or duration of this far-off felicity. In fact, the common Christian conception of a millennium without a visibly present Christ, as held at the present day, is little different, so far as results are concerned, from the belief of philosophers in the perfectibility of the race. The essence of both conceptions is the cessation of sin and sorrow, the prevalence of holiness and happiness. But this departs widely from the "ancient hope of the church"—a kingdom of visible majesty, with Jesus and the saints ruling the world from Jerusalem, the central city of the earth!

Great eagerness and not a little ingenuity have been exhibited by many persons in fixing a date for the commencement of the millennium. The celebrated theologian, Johann Albrecht Bengel (*Erklärte Offenbarung; Reden für's Volk*), who, in the 18th c., revived an earnest interest in the subject among orthodox Protestants, asserted from a study of the prophecies that the millennium would begin in 1836. This date was long popular. Bengel's general millenarianism was adopted by Oetinger (d. 1782), and widely spread throughout Germany in a more or less poetic form by Hahn, Crusius, Jung Stilling, Lavater, and Hess (*Briefe über die Offenb. Joh.*). Some of the greatest of the more recent German theologians are millenarians, such as Rothe, Delitzsch, Hoffman, Kurtz, Hebart, Thiersch, Nitzsch, P. Lange, and Ebrard. Swedenborg, to whom reference has already been made, held that the last judgment took place in 1757, and that the new church, or "Church of the New Jerusalem," as his followers designate themselves—in other words, the millennial era, then began. In America, considerable agitation was excited by the preaching of one William Miller, who fixed the second advent of Christ about 1843. Of late years, the most noted English millenarian is Dr. John Cumming, who originally placed the end of the *present dispensation* in 1866 or 1867; but as that time drew near without any millennial symptoms, he was understood to have modified his original views considerably, and now conjectures that the beginning of the millennium will not differ so much after all from the years immediately preceding it, as people commonly suppose. See Corrodi's *Kritische Geschichte des Chiliasmus* (Zurich, 1794, 4 vols.); Calixtus, *De Chiliasmo cum antiquo tum pridem renato Helmst.* (1692, 4to); Klee, *Tentam Hist. crit. de Chil. prim. sæc. Herbip.* (1825); Münter, *Dogmengeschichte*, etc. A really good history of chiliasm, however, is as yet a desideratum.

MILLEPEDE, a popular name of many kinds of *myriapoda*, of the order *chilognatha*, and chiefly of the families *julidæ* (see JULUS) and *Polydesmidæ*. In the latter family, the feet are arranged in numerous groups along both sides; otherwise, they much resemble the *Julidæ*. The largest species are found in warm climates, and some of them are brightly colored; but small species of both families are common in Britain; and some of them, as *Polydesmus complanatus*—which is lilac-colored, flattened, and from a quarter to half an inch in length—are very destructive to the roots of plants. Doubt has been expressed if they attack roots perfectly healthy; but at all events, they take advantage of incipient decay, and greatly extend and accelerate it. The application of salt, lime, nitrate of soda, etc., has been often recommended as a preventive of their ravages.—The name PILL MILLEPEDE is often given to those shorter *Chilognatha*, of the family *Glomeridæ*, which, when disturbed, roll themselves up into an almost globular form, like the crustacean called armadillo. *Glomeris marginata* is common in Britain, under stones and among moss. Some of the tropical species are large and finely colored.

MILLEPORE, a genus of hydrozoa which have recently been placed in a new subclass, *hydrocerallinæ* by Mr. Moseley. It contributes largely to the formation of coral reefs in the West Indies and Pacific. The calcareous skeleton is mostly in the form of laminar expansions having the surface studded with minute holes of two sizes, the larger being the fewest. The larger openings are the mouths of tubes which are divided by transverse calcareous partitions into a number of compartments, only the most superficial of which contain the animals. The smaller tubes are similarly constructed, and the general tissue of the skeleton is composed of trabeculæ traversed by a series of anastomosing canals which place the tubes occupied by the zoöids in direct communication. On account of some resemblance in the skeleton the *millepora* were formerly classed with the labulate corals. The late Prof. Agassiz was the first to examine the living animals, and he at once referred the genus to the *hydrozoa*. Mr. Moseley arrived at the same conclusion, and has recently had opportunities of examining the living animal minutely. According to him the colony of millepores consist of two kinds of zoöids. The larger, or gastrozoöids occupy the larger tubes of the skeleton, while the smaller, or dactylozoöids occupy the smaller tubes, which are generally placed around the larger in somewhat of a systematic arrangement. The small, or dactylozoöids have no mouth and are long and slender, carrying on their sides numerous short, clavate tentacles. They perform the functions of prehension for the colony, and supply food to the stomach bearing gastrozoöids, which perform the work of digestion and assimilation for the family. The nutritive fluid thus elaborated is distributed to the colony through branched

canals which ramify in every direction. The reproductive process is still unknown. See INVERTEBRATE ANIMALS.

MILLER, a co. in s.w. Georgia, drained by Spring creek, a branch of the Chattahoochee river, and intersected by the Atlantic and Gulf railroad; 260 sq.m.; pop. '80, 3,720—1393 colored. The surface is level and moderately productive; corn, oats, sweet potatoes, butter, molasses, and cotton, are the staples; of the last the annual yield is about 1700 bales. Chief town, Colquitt.

MILLER, a co. in s. Missouri, drained in the n. by the navigable Osage river; 600 sq.m.; pop. '80, 9,807—9,561 of American birth, 230 colored. Its surface is hilly and nearly equally divided between woodland and prairie; the timber including walnut and sugar-maple trees. In some sections, and along the river bottoms, the soil produces corn, wheat, oats, tobacco, and maple-sugar; and live stock is raised to some extent. The Osage river furnishes water-power, and lead and iron are mined. Lumber is manufactured. Capital, Tuscumbia.

MILLER, CINCINNATUS HEINE (JOAQUIN MILLER), b. Ind., 1841; while still a boy was taken to Oregon by his parents, and practiced mining in California. He now led an adventurous life, beginning as a volunteer with gen. Walker's Nicaragua expedition in 1855; continuing among the Indians of the Pacific coast; and concluding with his appointment to a county judgeship in Oregon in 1866. In 1860 he had made some attempt at studying law; and in the following year edited a paper at Eugene City, Or., which was suppressed by the authorities for disunion sentiments. In 1870 he visited the eastern states, and thence went to England; where, in the following year, he published his *Songs of the Sierras*, which caused him to be accepted for a time as a "lion" in London society. The poems contained in this volume had previously been published in the United States, where they had made very little impression. Mr. Miller afterwards published other volumes of poetry, and achieved a considerable reputation. He is the author of *The Danites*, which was successful in the United States and England.

MILLER, EDWARD, 1760–1812; b. Del.; son of the rev. John Miller, who was settled over a Presbyterian society in Dover, Del., 43 years, and brother of Samuel Miller, D.D., late professor in the theological seminary at Princeton, N. J. Having acquired a classical education, he attended a course of medical lectures at the university of Pennsylvania and had a year's experience at the military hospital at Baskingridge, N. J. He was surgeon's mate in the U. S. army in 1780, and in 1782 crossed the ocean as surgeon of a French ship of war. Retiring to private life in 1783, he had a successful practice in Frederica, Del., and in Maryland. In 1788 he received the degree of M.D. from the university of Pennsylvania. In 1797, associated with Dr. Samuel L. Mitchill and Elihu N. Smith, he established the *Medical Repository* in the city of New York, the first American medical journal, and was connected with it at the time of his death, witnessing the publication of the 14th vol. and a part of the 15th. He and his coadjutors were members of the Friendly club, whose list bore the names of Dunlap, Brown, Bleecker, and Kent. In 1803 he was appointed city physician of New York. He was a member of the American philosophical society, and published a *Treatise on the Yellow Fever of New York in* 1805, taking the ground that it was not contagious. He was connected with the university of New York in 1807 as professor of the theory and practice of medicine, and in 1809 with the New York hospital as clinical lecturer. He was very popular in the profession and had a large acquaintance. He was associated with his brother Samuel in his *Brief Retrospect of the Eighteenth Century*. He advocated temperance principles, and deprecated the use of tobacco. In 1814 a memoir of him was published by his brother Samuel in connection with his medical works; and in the *American Medical and Philosophical Register* has appeared a biographical notice by John W. Francis, M.D., of New York. He was distinguished for his learning as a scholar, his generosity and humanity as a physician, and held a high rank among American men of science.

MILLER, HENRY, 1751–1824; b. Penn.; originally intending to practice law, he became a member of the bar, but before becoming established the revolutionary war broke out and he left for the rendezvous with a lieutenant's commission, and marched with his company to Boston. He was soon promoted to col. of the regiment, and led his command in the New Jersey campaign. At the battle of Monmouth, June 28, 1778, between the American forces under Washington and the British under sir Henry Clinton, he had two horses shot under him, and he bore a record for dauntless bravery through the war. He was at one time quartermaster-gen., and at the close of the war turned his attention to mercantile pursuits, doing business in Baltimore. In the second year of the war of 1812 he held the position of brig.gen., commanding the defenses at Baltimore. On the restoration of peace he was appointed, among other offices of trust under government, to be superintendent of revenue for the district of Pennsylvania.

MILLER, HENRY, 1800–74; b. Ky.; studied medicine in Lexington with the celebrated surgeons Dudley and Caldwell, and, having taken his degree of M.D., commenced the practice of medicine in Glasgow, pursued it in Harrodsburg, and finally, in 1835, settled in Louisville as professor of obstetrics and diseases of women and children in the university school of medicine. He made frequent contributions to the prominent medical journals, and was much respected by the profession. In 1849 he published *Human*

Parturition, and in 1858 *The Principles and Practice of Obstetrics*, the latter work being a revision of the former enlarged and rewritten, adding the views of Dubois, Cazeaux, Simpson, W. Tyler Smith, and others to his own valuable experience, and giving the results of the obstetric schools of America, Paris, London, and Edinburgh—adapting the knowledge so gained to the wants of students. In 1859 he was elected president of the American medical association, and afterward professor emeritus in the Louisville medical college.

MILLER, HOMER V. M., b. Pendleton co., S. C., 1814; studied medicine at the state medical school of South Carolina, and graduated with high honors in 1835. He then spent three years in the further study of his profession in Paris, began practice in Cassville, Ga., and soon became known not only as a very skillful physician, but also as a public speaker and propagator of education and religion. He occupied a medical professorship at both Memphis, Tenn., and Augusta, Ga.; at the outbreak of the civil war became a surgeon in the confederate army, and was promoted to the rank of division surgeon and then medical director of the Georgia military department. From 1865 to 1869 he was a professor in the Atlanta medical college, and now resides in that city. In 1869 he was elected U. S. senator from Georgia to fill an unexpired term, and took an active part in the acceptance by the state of the reconstruction acts.

MILLER, HUGH, a distinguished geologist, was b. in Cromarty, in the north of Scotland, Oct. 10, 1802. He was descended from a family of sailors, and lost his own father by a storm at sea when he was only five years of age. In consequence of this misfortune he was brought up chiefly under the care of two of his mother's uncles, one of whom ("uncle Sandy") imbued him with a taste for natural, and the other ("uncle James") for traditional, history. He acquired a good knowledge of English at the Cromarty grammar-school. Before his 11th year he had read those glorious romances of childhood, *Jack the Giant-killer, Jack and the Beanstalk, Sindbad the Sailor, The Yellow Dwarf*, and *Aladdin and the Wonderful Lamp*, besides several other works of higher literary pretensions. As he grew older he became extremely fond of the great English poets and prose writers. From his 17th to his 34th year he worked as a common stone-mason, devoting his leisure hours to independent researches in natural history, and to the extension of his literary knowledge. In 1829 he published a volume entitled *Poems written in the Leisure Hours of a Journeyman Mason*, which was followed, a few years afterwards, by *Scenes and Legends of the North of Scotland*. His attention was soon drawn to the ecclesiastical controversies which were agitating Scotland, and his famous *Letter to Lord Brougham* on the "Auchterarder case" brought him prominently into notice. In 1840 he went to Edinburgh as editor of the *Witness*, a newspaper started in the interest of the non-intrusion party in the church of Scotland, and in the course of the same year published in its columns a series of geological articles, which were afterwards collected under the title of *The Old Red Sandstone, or New Walks in an Old Field*. These articles were very remarkable, both in a scientific and literary point of view. They contained a minute account of the author's discovery of fossils in a formation believed, until then, to be destitute of them, and written in a style which was a harmonious combination of strength, beauty, and polish. At the meeting of the British association in the same year (1840) he was warmly praised by Murchison and Buckland, and in fact his discoveries were the principal topic of discussion among the savans. His editorial labors during the heat of the disruption struggle were immense, and so seriously injured his health that for some time he had to give up all literary activity. About 1846 he resumed his pen, and became the most vigorous and eloquent writer in the service of the newly constituted free church. After ten years of hard, earnest, fagging toil his brain gave way, and in a moment of aberration he put an end to his own existence, at Portobello, near Edinburgh, on the night of the 23d or morning of the 24th Dec., 1856. Miller's principal works, besides those already mentioned, are: *First Impressions of England and its People; Footprints of the Creator, or the Asterolepis of Stromness*, designed as a reply to the *Vestiges of the Natural History of Creation; My Schools and Schoolmasters, or the Story of My Education;* and *Testimony of the Rocks*, the last of which is an attempt to reconcile the geology of the Pentateuch with the geology of nature, by the hypothesis that the days mentioned in the first chapter of Genesis do not represent the actual duration of the successive periods of creation, but only the time occupied by God in unrolling a panoramic vision of these periods before the eyes of Moses.

Miller's services to science have undoubtedly been great, but he is even more distinguished as a man than as a savant. Honest, high-minded, earnest, and hugely industrious, a true Scot, a hearty but not a sour Presbyterian (for he loved Burns as much as he revered Knox), there are few of whom Scotland has better reason to be proud than "the stone-mason of Cromarty." Besides his autobiography quoted above, see Life by Peter Bayne (2 vols., 1871).

MILLER, JAMES, 1776–1851; b. N. H.; was educated for the bar, but when not far from 30 years old entered the army as maj. and took part in the frontier warfare, where he displayed great gallantry. In 1812 he was made col. by brevet, and in 1814 took part in the Canadian invasion in command of the 21st infantry. In the battles of Chippewa and Lundy's Lane he did material service. The latter contest was virtually decided by his gallant charge on a British battery. These services were recognized by congress: a

gold medal was presented him, and he was promoted to the rank of brig.gen. From 1819–25 he was governor of Arkansas, then a territory; and from that time until he reached the age of 73 was collector of the port of Salem, Mass.

MILLER, JOAQUIN. See MILLER, CINCINNATUS HEINE.

MILLER, JOSEPH, 1684–1738, an English actor of low comedy, whose name can be found in the casts of Congreve's plays. He was noted for his wit off as well as on the stage, and his name was given to a collection of jokes printed by one John Motley in 1739. The term "a Joe Miller" is now in common use to denote an ancient or stale witticism. The tomb of the original Joe Miller may still be seen in St. Clement's churchyard in the Strand, London.

MILLER, PATRICK, 1730–1815; b. Dalwinston, Scotland. A man of wealth and of a mechanical turn of mind, he began in 1785 to experiment in the construction and propulsion of a vessel in a lake near his estate, and in 1786 gave an account of a vessel which he had made, maintaining in a pamphlet that the steam-engine could be made to work the wheels. With the aid of James Taylor he propelled a boat 5 m. an hour by the steam-engine. But for some reason the experiment was unsatisfactory, and was abandoned.

MILLER, SAMUEL, D.D., 1769–1850; b. Delaware, son of the rev. John Miller, who was a native of Boston and pastor of the Presbyterian church at Dover, Del. The son was graduated at the university of Pennsylvania in 1789 with the highest honors of his class; commenced the study of theology with the guidance of his father and finished the course under Dr. Nesbit, at Dickinson college; was licensed to preach in 1791; in 1793 was colleague pastor with Drs. McKnight and Rogers, of the first Presbyterian church, New York city, and afterwards of the Wall street church until 1813. He was active in establishing the theological seminary at Princeton, N. J., in which he was professor of church history and government from 1813 till his death. His admirable natural qualities of person, mind, and heart were highly improved by assiduous culture. His manners were remarkably dignified and urbane. In character and attainments he was eminently qualified to be one of the founders and builders of a theological school, and his influence, combined with that of his distinguished colleague Dr. Archibald Alexander—the one being an admirable complement to the other—on successive classes of students can hardly be over-estimated. His preaching was luminous and earnest, his lectures were learned, catholic, enthusiastic, and enlivened with wit and literary grace. He was prominent in the counsels of the Presbyterian church. Among the many works which he published may be mentioned: *Letters on the Constitution and Order of the Christian Ministry; Letters on Unitarianism; On the Eternal Sonship of Christ; Clerical Manners and Habits; On the Utility and Importance of Creeds and Confessions; On the Office of Ruling Elder; On Baptism; Letters from a Father to his Son in College; Thoughts on Public Prayer.*

MILLER, THOMAS, 1807–74; b. Gainsborough, Lincolnshire, Eng. At first a farmer's boy, then a basket-maker, he spent his leisure in study, and wrote pieces in poetry and prose on rural life and scenery, which attracted attention, and were noticed with favor by Moore, Campbell, and Rogers. By the help of Rogers he became a bookseller. His principal novels are *Royston Gower; Fair Rosamond; Lady Jane Grey; Gideon Giles the Roper; Godfrey Malvern.* Among his popular books are those pertaining to the country, including *A Day in the Woods; Beauties of the Country; Rural Sketches; Pictures of Country Life; Country Scenes.* His poems are entitled, *Common Wayside Flowers; Poetical Language of Flowers; Original Poems for my Children; Songs for British Riflemen.* He wrote also a *History of the Anglo-Saxons,* and *Lives of Turner, Beattie, and Collins.*

MILLER, WILLIAM, 1781–1849; b. Mass; served during the war of 1812 as a volunteer with the rank of captain, on the Canadian frontier. He was a farmer, and his education limited, but he applied himself to the study of the prophecies, and in 1833 began to lecture on the second coming of Christ, and to predict the destruction of the world in 1843. The very day was named either by himself or by his followers. For 10 years he continued his prophecies, and his converts in the United States, Canada, and Great Britain, called Millerites, Adventists, or Second Adventists, were estimated at 50,000. In consequence of the repeated failure of his predictions his followers gradually forsook him. They, however, regarded him as a man of more than ordinary intellectual power, a cool and honest reasoner, and a sincere devoted Christian. This may be conceded, though he evidently was a blind and ignorant guide.

MILLER, WILLIAM ALLEN, 1817–70; b. England, was a student first at the merchant tailor's school, and having served five years in apprenticeship to his uncle, who was hospital surgeon at Birmingham, took his degree at King's college, London, studying chemistry with Dr. Daniell, under whose direction he investigated the electrolysis of salts. He afterward went to Giessen and studied in the laboratory of Liebig. In 1840 he became demonstrator of chemistry in King's college, London, and in 1845 professor of chemistry there. He has contributed valuable scientific articles to medical and philosophical journals, and in 1851 was appointed assayer at the mint and bank of England, and water commissioner. He was elected president of the chemical society, and vice

president of the royal society; and published in 1850 *Elements of Chemistry, Theoretical and Practical.*

MILLER, WILLIAM HALLOWES, b. in 1801 in Carmarthenshire, Wales; educated at St. John's college, Cambridge, and after graduating in 1826, became a fellow and tutor of the college; in 1832 was appointed professor of mineralogy; in 1838 was elected a fellow of the royal society, and since has been elected a member of all the great scientific and philosophical societies of Europe and America. From 1843 to 1854 prof. Miller was engaged as member of a government commission in replacing the standards of weight and measure, which had been destroyed by fire, taking as his share of the work the standard of weight; in 1867 he was again placed on a commission to examine the exchequer standards, and in 1867 on the "*commission internationale du mètre.*" The reports of these bodies all gave the credit of their success in great part to prof. Miller's accuracy and scientific experience. He was one of the first to employ the Wallaston goniometer in measuring the angles of crystals, and among his many contributions to the *Proceedings of the Royal Society*, and other scientific publications, are several articles on the subject of crystallography. In 1865 the degree of LL.D. was bestowed upon him by Dublin university, and in 1876 Oxford made him a doctor of civil laws; he was for 17 years secretary of the royal society.

MILLERITES. See ADVENTISTS, *ante;* SEVENTH DAY ADVENTISTS; MILLER, WILLIAM.

MILLER'S FALLS, a village in Massachusetts, partly in the township of Montague and partly in Erving, in the county of Franklin. It was originally called Grout's Corners; and is pleasantly situated on Miller's river, which affords valuable water power near the point where it empties into the Connecticut. It is at the junction of the New London Northern and the Vermont and Massachusetts railroads. It has extensive factories, where tools are made; and it has an increasing trade.

MILLER'S THUMB. See BULLHEAD.

MILLET, a grain, of which there are several kinds, the produce of species of *panicum, setaria,* and allied genera. The genus *panicum* contains many species, natives of tropical and warm temperate countries, and some of which, as *Guinea grass* (q.v.), are amongst the largest fodder grasses. The flowers are in spikes, racemes, or panicles; the glumes very unequal, one of them often very minute; each spikelet containing two florets, one of which is often barren. The genus *setaria* has a spike-like panicle, with two or more bristles under the glumes of each spikelet. COMMON MILLET (*panicum miliaceum*) is an annual grass, 3 or 4 ft. high, remarkably covered with long hairs, which stand out at right angles. It has a much branched nodding panicle; the spikelets are oval, and contain only one seed. It is a native of the East Indies, but is extensively cultivated in the warmer parts of Europe and other quarters of the world. It succeeds only in those climates in which wine can be produced. It is called *warree, cheena,* and *kadi-kane* in India. The grain, which is very nutritious, is only about one-eighth of an inch in length. It is used in the form of groats, or in flour mixed with wheat-flour, which makes a good kind of bread; but bread made of millet alone is brittle and full of cracks. Poultry are extremely fond of millet. The straw is used for feeding cattle. Other species, *P. miliare, P. frumentaceum,* and *P. pilosum,* are cultivated in different parts of India, chiefly on light and rather dry soils, yielding very abundant crops. GERMAN MILLET, or MOHAR (*setaria Germanica*), and ITALIAN MILLET (*S. Italica*), regarded by many as varieties of one species, and probably originally from the east, although now naturalized in the south of Europe, are cultivated in many of the warmer parts of Europe, in India, and other countries. Italian millet is 3 or 4 ft. in height; German millet much dwarfer, and its spike comparatively short, compact, and erect; and less valuable as a corn-plant. The grains of both are very small, only about half as long as that of common millet; but they are extremely prolific, one root producing many stalks, and one spike of Italian millet often yielding 2 oz. of grain. The produce is estimated as five times that of wheat. Italian millet is called *koongoonie, kala-kangnee,* and *kora-kang* in India. The grain of these millets is imported into Britain for feeding cage-birds, and for use as a light and pleasant article of food, although for this purpose it is little used in Britain, whilst it is very extensively used in soups, etc., in the south of Europe. It does not make good bread. To the same tribe of grasses belong the genera *paspalum, pennisetum, penicellaria, digitaria,* and *milium*—species of which are cultivated in different parts of the world for their grain. *Raspalum exile* is the *fundi* (q.v.) of Africa; and *P. scrobiculatum* is the *koda* of India, where it is cultivated chiefly on poor soils. *Penicillaria spicata,* or *pennisetum typhoideum,* is very extensively cultivated in Africa, and to a considerable extent in India. Its cultivation has been introduced into the south of Europe. It succeeds best on light soils. Its Indian name is *bajree.* It often receives the names EGYPTIAN MILLET and GUINEA CORN. It has a somewhat spiked cylandrical panicle. *Pennisetum distichum* abounds in central Africa, on the southern borders of the Great Desert, where it is called *uzak,* and is described by Barth as causing much inconvenience to the traveler, the little bristles which are attached to its seeds making them stick like burs to the clothes; they also pierce the skin, and cause sores, so that it is necessary to be provided with small pincers for their extraction, and none even of the wild roving

natives is ever without such an instrument. But its seed is a common and pleasant article of food, in some places the principal food of the people, and a pleasant beverage is made from it. *Digitaria sanguinalis* is called POLISH MILLET, being cultivated in cottage gardens in Poland, where the grain is used like rice. It is a common grass in many parts of Europe, although very rare in Britain. The spikes in this genus are compound, and from their appearance give it the names *digitaria* and *finger-grass*. The MILLET GRASS (*milium effusum*) of Britain, occasionally found in shady woods, is a very beautiful grass, 3 or 4 ft. high, with a spreading pale panicle of small flowers; and has been much recommended for cultivation as a forage grass, and for the sake of its very abundant small seeds, an excellent food for game. Another species of the same genus (*M. nigricans*) is the *Maize de Guinea* of Peru, where its seeds, after being dried by heat, are converted into a very white flour, a pleasant article of food; and a beverage called *ullpu* is made from them. The name INDIAN MILLET is sometimes given to *durra* (q.v.), but it belongs to a different tribe of grasses from the true millets.

MILLET, AIMÉ, b. in Paris about 1816; son of a distinguished French painter; after studying painting under his father he studied sculpture under David d'Augers, and has become famous. Imaginative busts, female figures, busts of distinguished men, and lastly colossal figures for bronze, have indicated his genius from the commencement of his career. "L'Ariane," a female figure exhibited in 1857, regarded as one of his greatest works in marble, was bought by the government. His statue of "Mercure" for the court of the Louvre, exhibited in 1859, and "Vercingetorix," a colossal statue in bronze, finished in 1865, are among his later best works. "Apollon," the statue which crowns the grand opera house of Paris, is by him. Millet's scientific knowledge of the human form is said to equal his grace and skill in its molding.

MILLET, JEAN FRANÇOIS, 1815–75; student of painting with Delaroche in Paris. He commenced exhibiting pictures in 1844 with *la Laitière et la Leçon d'Equitation;* in 1845 exhibited *Œdipe détaché de l'Arbre;* in 1848 *les Juifs à Babylone.* From that time a marked change came over his style, and from methods of representation distinguihsed for rough vigor, he became painter of pastoral pieces of the greatest refinement of thought and execution. Of this class are the *Sémeur, La Paysanne Assis,* and *Les Botteleurs,* exhibited in 1849 and 1850. He has since become one of the greatest landscape painters in France by representations of field, peasant, and animal life the most quiet, simple, and noble. Among these are the *Berger Moissoneurs, Tondeurs de Moutons,* 1852; *Paysan se Réposant sur sa Houe,* 1863; *Bergére avec son Tronpeau,* 1864; and *Femme Battant du Beurre,* 1870. All his works are favorite subjects for engravings, and have thus become familiar works everywhere.

MILLET, PIERRE, 1631–1708; a French missionary who died in Quebec. He came to America in 1666, and labored among the Onondagas and Oneidas till 1684. Afterwards chaplain at ft. Frontinac (Kingston. Canada), from which he was lured, and taken prisoner by Indians in the service of the English. The Christianized Oneidas adopted him into their tribe, much to the chagrin of the English governor of New York, who was suspicious of his French influence with the Indians. The French governor of Canada was quite content with the situation. The narrative of his captivity was preserved and published in New York in 1865.

MILLIER. See METRIC SYSTEM.

MILLI, GIANNINA, b. in 1828 in Italy. When but a child she began to practice the composition of verses, and when a girl of seventeen or eighteen became a pupil of the poet Regaldi, the greatest of Italian improvisatores, and soon developed considerable power in improvising popular and amatory verses. As is the custom with artists of this class, she traveled and gave public exhibitions of her skill in various parts of Italy and Sicily Medals of gold and silver were awarded her, and after her trips through Tuscany and upper Italy (1857–60) a pension was bestowed upon her by Garibaldi. Since that time she has been engaged as instructress and superintendent in the schools of Naples and Rome. A number of her best efforts have been collected and published.

MILLIGRAM. See METRIC SYSTEM.

MILLIL'ITER. See METRIC SYSTEM.

MILLIM'ETER. See METRIC SYSTEM.

MILLRIND, or FER DE MOULIN, in heraldry, a charge meant to represent a mill-iron, originally a mere variety in designating the cross moline, but accounted a distinct charge by some heralds.

MILLS, a co. in s.w. Iowa; drained by the Missouri, which bounds it on the w., and by the Nishnabatona river and Keg creek, and intersected by the Kansas City, St. Joseph and Council Bluffs, and Missouri River railroads; 460 sq.m.; pop. '80, 14,135—12,860 of American birth. The surface is in great part prairie, but there are extensive woodlands. Hay, wheat, oats, Indian corn, and pork are the chief products. Co. seat, Glenwood.

MILLS CHARLES, 1788–1825; b. near Greenwich, Eng.; admitted to the bar in 1809, but devoted himself chiefly to historical study. He is the author of *History of Moham-*

medanism; History of the Crusades, 2 vols.; *Travels of Theodore Ducas*, 2 vols.; *History of Chivalry*, 2 vols.

MILLS, CLARK, b. in Onondaga co., N. Y., 1815, of poor parents; learned the trade of plasterer; and practiced it in Charleston, S. C., for nine years. Developing a taste for sculpture, in 1846 he completed a bust of John C. Calhoun, which was purchased by the city of Charleston for the city hall. In 1848 he furnished a design which was accepted, for an equestrian statue of gen. Jackson, to be placed in Lafayette square, Washington. There being no bronze-foundry for such work in the United States, Mills, after spending two years in modeling the statue, set to work to learn the art of such castings, and erected in Washington an experimental foundry, where, after many mishaps and trials he at last succeeded in Oct., 1852, in producing a perfect cast. It was accepted formally Jan. 8, 1853—the anniversary of the battle of New Orleans. Congress made an extra appropriation of $20,000 to cover his losses, and remunerate him for his time. He was next engaged on the colossal equestrian statue of Washington, which was formally received Feb. 22, 1860. For this he received $50,000. Mr. Mills's last great work was the casting of the colossal statue of Liberty, finished in 1863, which crowns the dome of the capitol at Washington. This was modeled by Crawford. There has been much harsh criticisms of Mills's equestrian statues. Doubtless the work of one without schooling in the great art of sculpture compares unfavorably with that of masters. But there are now enough poor works in the United States by those who have had the highest advantages to show that Mills had the genius for great and good work. His errors are mostly in endeavoring to render his subjects too striking, too expressive. This is especially the case with the statue of gen. Jackson, in which the horse is made to balance reared on its hind feet, and the gen. appears equally excited. Continued through many decennial periods, the pose becomes ridiculous.

MILLS, SAMUEL JOHN, Jr., 1783–1818; b. Conn.; graduated at Williams college in 1809. While in college he formed an association among those students who were considering the question of entering upon foreign missionary work. After spending a short time in the study of theology at New Haven, he entered Andover theological seminary in 1810, where, being deeply impressed with the importance of foreign missions, he endeavored to awaken the same spirit among his fellow-students. With Judson, Hall, Newell, and Nott he united in a memorial to the General association of Massachusetts (Congregational), which resulted in the formation of the American board of commissioners for foreign missions. He was licensed to preach in 1812, and spent two years in mission work in the southern and western states with Messrs. Schermerhorn and Smith. On his return he was ordained June 21, 1815. He published an account of his tour. Finding great destitution of the Bible in those states, he suggested at the close of his report the formation of a national Bible society, which resulted in the organization of the American Bible society. To him was due the formation of the *United* foreign mission society, and also the African school at Parsippany near Newark. Through his exertions in conjunction with Dr. Finley, the American colonization society was formed in 1817, and he was appointed with Dr. Burgess to visit England in behalf of the society, and to explore the west coast of Africa for a suitable site for a colony of colored people from America. He sailed in Nov., 1817, and wonderfully escaped shipwreck on the coast of France. Embarking from England for Africa Feb. 2, 1818, he arrived on the coast Mar. 12. After faithfully exploring it, he embarked for the United States in the brig *Success* May 22, 1818. Having taken a severe cold which was followed by fever, he died at sea June 16. He is called the "father of foreign missions in America." A memoir of him was published by the Rev. Dr. Gardiner Spring.

MILLSTONE. See BUHR-STONE, *ante*.

MILLSTONE GRIT, a species of conglomerate composed of silicious sand and small pebbles. It is named from its frequent use for millstones in England. Its geological position is at the commencement of the coal formation or the terrestial period. The beds along the Appalachian range in Pennsylvania are very coarse and are over 1200 feet thick. The rock here is a light-colored silicious conglomerate, interstratified with some sandstone, and thin beds of carbonaceous shells. In Virginia the beds are sometimes 1000 feet thick, but here it is principally sandstone, containing, however, deep beds of conglomerate. In Alabama the rock becomes quartzose, is of great thickness, and is used there for millstones. Millstone grit also extends into the southern tier of counties in New York, sometimes attaining a thickness of 50 or 60 feet. In Cattaraugus and Alleghany counties it has a cuboidal structure, which in the course of time has had portions worn and washed away leaving large blocks standing alone, and having various shapes which have suggested such names as "Rock city" and "Ruin city." Fossil plants found in the formation are ferns, calamites, lepidodendrons, and sigillaria.

MILLTOWN, a v. in Washington Co., Maine, on the St. Croix river. The chief business is the manufacture and shipment of lumber. It is on the St. Croix and Penobscot railroad, and is a part of the city of Calais.

MILLTOWN, a t. in Charlotte co., New Brunswick, on the St. Croix river, opposite Milltown, Maine. Pop. 2,000. It has 3 churches, a library, and an academy. The principal business is the sawing and shipment of lumber, of which great quantities are

exported. There is also a tool-factory. The St. Croix river is here spanned with several bridges.

MILLVILLE, a city in s. New Jersey, on the West Jersey railroad; pop. '70, 6,101. It is at the head of navigation on the e. bank of the Maurice river 40 m. from Philadelphia and 6 m. s. of Vineland; in a fine agricultural region, with a large local trade. It contains a fine city hall and post-office, 9 churches, a national bank, 4 hotels, and 2 weekly newspapers. Its leading industries are manufactures of lumber, cotton, iron, window glass, and hollow glass-ware. Water and gas pipes are made, and turbine water-wheels; immense wheels for water-works being exported to northern cities. It has excellent public schools.

MILMAN, HENRY HART, D.D., an English poet and ecclesiastical historian, was the youngest son of sir Francis Milman, physician to George III., and was b. in London, Feb. 10, 1791. He was educated at Eton, and afterwards at Brasenose college, Oxford, where he took the degree of M.A., obtained the Newdegate prize in 1812, published *Fazio, a Tragedy* (which was successfully brought upon the stage at Covent garden), in 1815, took orders in 1817, and shortly after was appointed vicar of St. Mary's, Reading. In the following year appeared his *Samor, Lord of the Bright City, an Heroic Poem*, which was followed in 1820 by the *Fall of Jerusalem*, a beautiful dramatic poem, with some fine sacred lyrics interspersed. In 1821 Milman was chosen professor of poetry at Oxford, and published three other poems in the course of the same year—*The Martyr of Antioch, Belshazzar, Anne Boleyn*. His *Sermons at the Bampton Lecture* appeared in 1827, and his *History of the Jews* (3 vols.) in 1829. The last of these works did not bear the author's name; it was written in so liberal and tolerant a spirit that ecclesiastics of the stricter sort could hardly fail to be offended. Its weak point was a want of adequate learning, especially in the department of biblical criticism. A new edition, greatly improved and more critical, yet still far from being very accurate or built on solid foundations, with an interesting preface, was published in 1863. In 1840 appeared a collected edition of his *Poetical Works*, containing some other pieces besides those already mentioned. The same year witnessed the publication of his *History of Christianity from the Birth of Christ to the Abolition of Paganism in the Roman Empire* (3 vols.). In 1849 he was made dean of St. Paul's; and in 1854 published his masterpiece, *History of Latin Christianity, including that of the Popes to the Pontificate of Nicholas V.* (3 vols.). It is a work of great learning, liberality, and chastened eloquence; it displays a broad grasp of human nature in its religious workings; besides a philosophic and poetical sympathy with the different men and opinions which it reviews. The work secured for its author a position in the first rank of English historians. Milman edited Gibbon, and contributed extensively to the *Quarterly Review*. He died in 1868. A posthumous work contains his *Essays on St. Paul, Savonarola, Erasmus*, etc.

MILMORE, MARTIN, b. Mass., 1845; began his studies in sculpture under the direction of Thomas Ball. His first effort which attracted public attention was his modeling of the alto-relief *Phosphor*, an ideal subject, which gained the favor of patrons of art. He produced a statuette of *Devotion*, and was given commissions for an ideal of *Miranda*, and the busts of George Ticknor, Longfellow, gen. Thayer, and Sumner, previous to 1864, and in that year he commenced work on the granite statues surmounting the front of Horticultural hall in Boston, and those of Flora and Pomona, ornamental figures, which were placed in position in 1866. In the following year he designed a bronze statue for the soldiers' monument at Forest Hill cemetery, Boston highlands, and was the sculptor of the army and navy monument on Flagstaff hill, Boston common, 90 ft. in height, erected at a cost of $75,000, dedicated Sept. 17, 1877. On the four sides of the plinth are bronze mezzo-relievos, one representing the departure of troops, one symbolical of the sanitary commission, another the return from the war, and the fourth to commemorate the achievements of the navy, the departure, and the naval engagement. Above this plinth, 9 ft. high, rises a shaft of white Maine granite of the Roman-Doric order, surmounted by a bronze ideal statue of the genius of America. Bronze figures representing peace, history, the army, and the navy stand on the pedestals at the four corners, and about its base are grouped figures in alto-relievo representing the four sections of the union, north, south, east, and west.

MILNE, WILLIAM, D.D., 1780–1822; b. England. In 1813 he visited China under the London missionary society, traveled extensively in China, Malacca, and other islands of the Indian archipelago. In 1815 he went as missionary to Malacca, translated the Scriptures, superintended the publication of religious works and of a monthly magazine, and presided over the Anglo-Chinese college on which Dr. Morrison had bestowed much labor. He also took part in translating the Old Testament into Chinese, and established a quarterly publication entitled *Indo-Chinese Gleaner*. He published *Retrospect of the Protestant Mission to China*.

MILNE-EDWARDS, HENRI, the most eminent living representative of the French school of natural history, was born at Bruges in 1800. His father was an Englishman. Milne-Edwards studied medicine at Paris, where he took his degree of M.D. in 1823, but abandoned medicine to devote himself to natural history. He was first appointed professor of natural history in connection with the Lycée Henri Quatre, and afterwards to the

Museum and the Faculté des Sciences, of which he is now president. In 1838, he was elected a member of the Academy of Sciences (section of Anatomy and Zoology); and in 1854 was chosen a member of the Académie de Médecine. He is also a member of many other societies, French and foreign, and a commander of the Legion of Honor. Milne-Edwards is distinguished for his extensive knowledge of comparative anatomy and physiology well as of zoology. Passing over some of his early works, which, though valuable, are thrown into the shade by his later ones, we come to his *Monograph on the Crustacea* (1837–41), which is universally regarded as of pre-eminent merit, not only for its richness of detail, but also for the value of the general doctrines relating to homologies, development, geographical distribution, and other points of the highest physiological interest. In 1840, an improved edition of his *Elements of Zoology*, a work in 4 vols., and containing 600 illustrations, began to appear. In 1841 he published his researches on the Compound Ascidian Mollusca, which have led to an entirely fresh appreciation of some of the most important points in the history of that group, such as, that *propagation by gemmation*, which had been previously supposed to be a zoophytic character, is equally true of the lower mollusca. In other departments of science, Milne-Edward has been equally successful; but it is to the invertebrate animals that his chief attention has been given, and in each of the three Cuvierian sub-kingdoms, *Articulata*, *Mollusca*, and *Radiata*, his researches have been so important, that what he has accomplished for either alone would suffice to establish for him a high scientific reputation. In 1856 Milne-Edwards obtained the Copley Medal of the Royal society of London. His later works include *Lectures on Physiology*, and on the *Comparative Anatomy of Men and Animals* (1855-57); *History of the Mammalia* (1872, *et seq.*); etc.

MILNER, JOHN, D.D., 1752–1826; b. London; educated at Edgbaston and Douai; took orders, and in 1779 had charge of Winchester chapel. Though a zealous Roman Catholic he refused to join in the attempt in 1788 and 1791, to obtain from parliament the repeal of the laws against the Roman Catholics. He was devoted to the study of archæology, on which he published several works, for which he was admitted in 1790 to the royal antiquarian society. He was engaged in several religious controversies both with Protestant theologians and the Roman Catholic clergy. In 1803 he was appointed vicar-apostolic of the midland district and bishop of Castabala. His chief publications are *History Civil and Ecclesiastical, and Survey of the Antiquities of Winchester*, 2 vols.; *The End of Religious Controversy; Letters to a Prebendary; A Dissertation on the Modern Style of Altering Cathedrals; Treaties on the Ecclesiastical Architecture of England during the Middle Ages; Divine Right of the Episcopacy; Notes on Ireland.* His works are numerous, but none are more highly valued by Roman Catholics than his *End of Controversy* and *Letters to a Prebendary.* He was a man of great learning and acuteness.

MILNER, JOSEPH, an ecclesiastical historian who once occupied a respectable place in literature, was born near the town of Leeds, in Yorkshire, Jan. 2, 1744. He studied at Catharine Hall, Cambridge, where he took the degree of B.A. in 1766, and afterwards became head-master of the grammar-school at Hull. In this capacity, his success was very great. Shortly after, he was appointed lecturer in the principal church of the town, and in 1797, vicar of Holy Trinity church. He died Nov. 15th of the same year. Milner's principal work is his *History of the Church of Christ*, of which he lived to complete 3 vols., reaching to the 13th c. (1794); a fourth volume, reaching to the 16th c., was edited from his MSS. by his brother, DR. ISAAC MILNER, dean of Carlisle, who also published a comple edition of his brother's works in 8 vols., 1810. The principles on which the *History of the Church of Christ* is written are of the narrowest kind; the scholarship is poor, the literary merit still poorer, and the critical insight poorest of all. It deserves mention only for the estimation in which it was formerly held, at a time when the English church seemed sunk in ignorance and stupor.

MILNES, RICHARD MONCKTON, Baron HOUGHTON, English poet and politician, descended from an old Yorkshire family, was born in 1809, and educated at Trinity College, Cambridge. He entered parliament as M.P. for Pontefract in 1837, and continued to represent that borough until the close of the parliamentary session of 1863, when he was called to the upper house by the title of Baron Houghton. In the house of commons he began life as a conservative, but afterwards allied himself to the liberal party, and was a faithful follower of Lord Palmerston, when his foreign policy and high-handed dealings at the foreign office led to the temporary estrangement of that statesman from the whigs. Milnes has distinguished himself, however, rather by his philanthropic labors, and his speeches on behalf of the Italians, Poles, and other oppressed nations, than by his devotion to party politics. He has been the advocate of public education and religious equality. He carried, in 1846, a bill for establishing reformatories, and has taken a great interest in the reform of the criminal classes. Milnes has also cultivated the muses with grace and success. He has traveled much in oriental countries, and is the author of *Memorials of a Tour in Greece*, and also of poems called *Palm Leaves*, in which a poetical halo is thrown around the manners and domestic institutions of the East. His *Poems of Many Years*, and *Poems Historical and Legendary*, contain many simple and elegant effusions. In 1849, he edited the *Life, Letters, and Literary Remains of John Keats.* He has also written *Thoughts on Purity of Election; Monographs. Personal and Social* (1873–76); etc. His *Collected Poetical Works* appeared in 1876.

MILNOR, JAMES, D.D., 1773–1844; b. Philadelphia; studied in the university of Pennsylvania, but without completing the course, entered on the study of law and became a practitioner first at Norristown, Penn., and, from about 1797, in Philadelphia. Having by his marriage forfeited his birth-right in the Society of Friends, he attached himself to the Episcopal church, of which his wife was a member. While practicing law he was prominent in the civil councils of the city and, 1810–13, was one of its representatives in congress. Having, 1812, become a communicant of the church he prepared for the ministry, and, 1814, was ordained as a deacon, and 1815, as a presbyter. He was soon after chosen a minister of the united Episcopal churches in Philadelphia, Christ's church, St. Peter's, and St. James's. From 1816 until his death he was rector of St. George's church in New York city; his active service there being, however, interrupted, 1830, by a visit to Europe as a delegate from the American to the British and Foreign Bible society. He was a man of eminent piety, benevolence, wisdom, and dignity, exerting a great influence through the attractiveness of his Christian character. His published writings were chiefly occasional sermons.

MILO, the ancient Melos, a Greek island in the Cyclades group in the archipelago, about 65 m. e. of the Peloponnesus, in lat. 36° 40′ n., long. 24° 23′ e.; 65 sq.m.; pop. about 3,500. The surface is mountainous, showing traces of volcanic action; and Mt. Calamos is still occasionally active. Mt. St. Elias, in the n.w., the highest point, is 2,338 ft. above the sea level. The soil in the valleys is fertile, and produces wine, corn, oil, fruits, and cotton; but many portions are sterile, and the lowlands uncultivated and malarious. The ancient Melos, of which extensive ruins still exist, was situated on a deep bay in the n. coast. It was a colony of Phenicia, and afterwards of Lacedæmon. During the Peloponnesian war it was captured by the Athenians, who put the adult males to death and enslaved the women and children. The statue "Venus of Milo" was found near Melos, in 1820.

MILO, of Croton, in Magna Græcia (q.v.), an athlete famous for his great strength, who lived, according to Herodotus, in the time of Darius Hystaspes, about 520 B.C. Among other displays of his strength, he is said to have on one occasion carried a live ox upon his shoulders through the stadium of Olympia, and afterwards to have eaten the whole of it in one day; and on another (reversing the story of the Hebrew Samson), to have upheld the pillars of a house in which Pythagoras and his scholars were assembled, so as to give them time to make their escape when the house was falling. He is said to have lost his life through too great confidence in his own strength, when he was getting old, in attempting to split up a tree, which closed upon his hands, and held him fast until he was devoured by wolves.

MILO, TITUS ANNIUS PAPINIANUS, 95–48, B.C., b. Italy; belonged to a distinguished family, and married a daughter of Sylla. Few details of his life are known, till his election as tribune of the people in 57. He was then a partisan of Pompey, and attempted to bring about the recall of Cicero from exile. This measure, which was warmly supported by the Pompeian party was bitterly opposed by Clodius, who, as tribune of the people, had been instrumental in passing the law condemning Cicero to exile. Milo attempted to have Clodius condemned as a violator of the public peace, but the proceedings were quashed. Both Milo and Clodius now hired a body-guard of gladiators, and armed collisions between their retainers became almost every-day occurrences. About this time Milo, who had greatly reduced his fortune by the splendid spectacles which he had displayed to the people during his tribunate, married Sylla's daughter, Fausta, for her fortune. Sallust, the historian, was afterwards discovered in adultery with her, and after being severely handled was allowed to escape with his life only on paying a considerable sum of money to Milo. Meanwhile Cicero had come back, and both he and Pompey were continually attacked by Clodius. The latter was elected curule ædile in 56, and in his turn accused Milo of being a violator of the public peace by keeping a force of armed retainers. Pompey conducted the defense of Milo, but no decision was ever reached. In 53 Milo offered himself as a candidate for the consulship. Clodius opposed the candidature of Milo, who was defended in the senate by Cicero in a speech of which some fragments are still extant. On Jan. 20 of the next year Milo was on his way to Lanuvium from Rome, accompanied by his usual band of armed gladiators. Clodius, also with an armed company, met him near Bovillæ. Milo was dictator of Lanuvium, where he was going to take part in some religious ceremonies, with his wife and a friend, and a number of slaves. Clodius had about 30 slaves with him. Milo and Clodius passed each other without trouble; but some of Milo's followers picked a quarrel with the slaves of Clodius, who attempted to interpose, and was at once stabbed in the shoulder by one of Milo's men. Clodius was taken to a tavern in Bovillæ, but was dragged out by the slaves of Milo and put to death. The corpse of Clodius was placed on the rostra of the forum in Rome, and a great mob set fire to the senate house. These acts of popular violence created a reaction in favor of Milo, who ventured to return to Rome. But the disturbance in Rome soon became so great that Pompey was made subconsul. Milo was tried for the murder of Clodius, and though defended by Cicero, he was condemned to exile. He went to Marseilles, and while there received a revised copy of the speech which Cicero had intended to make in his favor. On reading it, he is said to have remarked that he was glad it had not been delivered, "For if so, I should

not now be eating such fine mullets at Marseilles." In his absence he was tried and condemned on charges of violence, of bribery, and conspiracy. In 48 he went back to Italy without permission, to join Marcus Cælius, an expelled senator, who was attempting to excite a rebellion in s. Italy, and he was killed before a fort near Thurii.

MILREE', MILREI, or MILREA, a Portuguese silver coin and money of account, contains 1000 rees, and is valued at 4s. 8½d. sterling. The coin is commonly known in Portugal as the *corõa*, or "crown," and is (since April 24, 1835) the unit of the money-system in that country. It is used in Brazil. The half-corõa, or half-milrei, of 500 rees, is also used in both countries. The name "milrei" was used in Portuguese accounts long before any coin representing its value existed.

MILTI'ADES, a celebrated Athenian general, "tyrant of the Chersonese," yet, as Byron sings, "freedom's best and bravest friend." Forced by Darius to flee from his dominions, he took refuge at Athens, and on the second Persian invasion of Greece, his military talents being of a high order, he was chosen one of the ten generals. He particularly distinguished himself by the great victory which he gained at Marathon (q.v.) with a small body of Athenians and 1000 Platæans (Sept. 29, 490 B.C.) over the Persian host, under Datis and Artaphernes. By this victory the Greeks were emboldened for the heroic struggle which they made in defense of their country and their liberty. Miltiades being intrusted with the command of an armament for the purpose of retaliating on the Persians, made an attack on the island of Paros in order to gratify a private enmity; but failing in the attempt, he was, on his return to Athens, condemned to pay a heavy fine as an indemnification for the expenses of the expedition. Being unable to do this, he was thrown into prison, where he died of a wound received at Paros. The fine was exacted after his death from his son Cimon (q.v.).

MILTON, a co. in n. central Georgia, drained by the Chattahoochee river, which forms its s. boundary; 150 sq.m.; pop. '80, 6,261—777 colored. The Piedmont Air Line railroad passes near Warsaw in the s.w. part of the county. The surface is rolling and fairly productive; Indian corn, sweet-potatoes, and wheat are the chief products. Chief town, Alpharetta.

MILTON, a t. in e. Massachusetts on the Old Colony railroad; pop. '80, 3,206. It is 7 m. from the old city limits of Boston, which is reached by a horse railway, and is on the Neponset river, which furnishes water-power for several manufactories; among them a paper mill and Baker's chocolate factory. The latter is an old land-mark, standing near the bridge that spans the river, on the opposite bank of which is the Dorchester district of Boston. Country produce is sent to the Boston market, and ice is exported. Leather and rubber goods are manufactured. It has excellent public schools, 3 churches, and many fine large estates, approached by long drives from the turnpike; and from the crest of one of the famous Milton Blue hills, following this fashionable drive, a view of the harbor, Boston light, Deer island, fort Warren, etc., may be obtained. Its roads are celebrated, being made of the dust of Quincy granite taken from ledges in the vicinity. It includes Milton Lower Mills, having 2 churches, a paper mill, and a granite quarry.

MILTON, a t. in Rock co., Wis., the post village of which is 62 m. by rail s.w. of Milwaukee, at the junction of the Monroe branch of the Milwaukee and St. Paul railroad with the Prairie du Chien division; pop. '70, 2,010. Milton college, established in 1867 by the Seventh-Day Baptists, is its chief institution.

MILTON, JOHN, an Engli h poet, was b. in Bread street, London, on Dec. 9, 1608. His father was of an ancient Catholic family, but was disinherited on becoming Protestant. He followed the occupation of a scrivener, by which, according to Aubrey, "he got a plentiful estate," and was a man of great musical accomplishment, being the composer, among other things, of the two well-known psalm-tunes *Norwich* and *York*. From him his son derived his matchless ear, and that strict integrity of character for which he is as famous as for his verse.

Milton was carefully nurtured and educated. He was first placed under the care of a private tutor named Young, a Scotchman by birth and education; and at the age of 12, was sent to St. Paul's school, London, and afterwards to Christ's college, Cambridge. According to the university register, he was admitted Feb. 12, 1624–25. He took his degree of M.A.; and having relinquished the idea of following divinity or law, he left Cambridge in 1632, and went to live at his father's house at Horton, in Buckinghamshire. There, in serenity of mind and passion, he lived five years, reading the Greek and Latin poets, and composing *Comus*, *Lycidas*, *Arcades*, *L'Allegro*, and *Il Penseroso*. On the death of his mother in 1637, he went abroad, visiting the chief Italian cities, and making the acquaintance of Grotius and Galileo. While traveling, being made aware that clouds were gathering in the political atmosphere at home, he returned in 1639, and engaged himself with the tuition of his nephews—on which portion of Milton's life, Dr. Johnson could not help looking with "some degree of merriment." In 1641 he engaged in the controversies of the times, and in the course of that and the following year he issued the treatises *Of Reformation*, *The Reason of Church Government urged against Prelacy*, *Prelatical Episcopacy*, and *An Apology for Smectymnuus*. In 1643 he married rather suddenly Mary, daughter of Richard Powell, an Oxfordshire royalist, but the union did

not at first prove happy. His wife, who had been accustomed to "dance with the king's officers at home," found her husband's society too austere and philosophic for her gay tastes. After the severe honeymoon was over, she obtained permission to visit her relatives till Michaelmas; but when Michaelmas came, she refused to return. Stern and proud, Milton repudiated her at once; and the matrimonial disagreement made the world the richer by four *Treatises on Divorce*. A reconciliation, however, took place, which, we have no reason to doubt, was both genuine and permanent. Mary Powell died in 1652–53, leaving him three daughters, Ann, Mary, and Deborah, of whose undutifulness and ingratitude we have latterly many complaints. In 1644 he produced his *Tractate on Education* and his *Areopagitica*—a flame of eloquence at which one may warm one's hands yet. After the execution of Charles, he was appointed Latin secretary to the council of state, with a salary of £290. In his new position his pen was as terrible as Cromwell's sword. In *Eikonoklastes* he made a savage but effective reply to the famous *Eikon Basilike;* and in his *Pro Populo Anglicano Defensio* he assailed his opponent, Claude de Saumaire, better known as *Salmasius*, with such a storm of eloquence and abuse that the latter, who died at Spa in 1653, is believed to have lost his life through chagrin. Milton at least flattered himself with having "killed his man." His second wife, whom he married Nov. 12, 1656, was a daughter of capt. Woodcock of Hackney. She died in childbed in Feb., 1658, and her husband has enshrined her memory in an exquisitely pure and tender sonnet.

Unceasing study had affected his eyesight, and about 1654 Milton became totally blind. After the restoration, he retired from affairs; he was obnoxious to the reigning power, and it is said that he was once in custody of the sergeant-at-arms. On the publication of the act of oblivion, he married his third wife, Elizabeth Minshull, and shortly after removed to a house in Artillery walk, when he was busy with *Paradise Lost*. This great poem was originally planned as a mystery; then some idea of treating it as a drama haunted the author's mind; finally, however, he resolved to write an epic poem on the Fall of Man. The poem was published in 1667. He received five pounds from his publisher, and a promise of other five pounds when 1300 copies should have been sold. In 1670 he published his *History of England*. Next year he printed *Paradise Regained* and *Samson Agonistes*. He died on Sunday, Nov. 8, 1674, and was buried next his father, in the chancel of St. Giles, at Cripplegate. He left property to the value of £1500.

Milton was, above all English poets, stately and grandiose. He arrived early at the knowledge of his powers, and did not scruple, in one of his prose tracts, to inform his readers that he proposed to write a poem which would be considered one of the glories of his country. Drawn away for a time by the heats of controversy and by official tasks, he never forgot his pledge, and redeemed it at last in old age, blindness, and neglect. In comparison, other poets are like sailing-ships, at the mercy of the winds of passion and circumstance; he resembled the ocean-steamer, which, by dint of internal energy, can pierce right through the hurricane. Never, perhaps, was a mind more richly furnished. His careless "largess" is greater than the fortunes of other men. His *Comus* is the very morning-light of poetry; while in his great epic there is a massiveness of thought, a sublimity of imagery, a pomp of sound—as of rolling organs and the outbursting of cathedral choirs—which can be found nowhere else. His great passages echo in the mind as if loath to die. Of all great writers, he is perhaps the one for whom we are conscious of the least personal affection, and this arises from a certain hauteur and severity which awes—which repels some natures; yet he infects his reader with his own seriousness. See Pattison's short life (1879); Stern's *Milton u. seine Zeit* (1878); and Masson's *Life and Times of Milton*, 6 vols. (1858–80).

MILUTIN, or MILYUTIN, Nikolai Alexeyevitch, 1818–72; b. Russia; educated at the lyceum of Moscow, graduating in 1835, at the expense of the czar Nicholas, who gave him a free scholarship at the university of St. Petersburg, where he finished his studies in 1838. In 1844 he was appointed chief of the press bureau, but left it to revise the Russian municipal laws. He was appointed by the czar on a committee concerning the serfs, and afterwards was under-secretary of the interior. When Alexander II. came to the throne in 1855, he was his confidential adviser. He countersigned the ukase of emancipation, Mar. 3, 1861, and prepared the laws required by that act. He was made secretary of the interior, and to him are due in Russia the criminal code, the press law, and trial by jury.

MILWAU'KEE, a co. in s.e. Wisconsin, having lake Michigan for its e. boundary; 240 sq.m.; pop. '80, 138,523—83,469 of American birth, 319 colored. It is traversed by the Chicago, Milwaukee and St. Paul railroad, the Chicago and Northwestern, Detroit, Grand Haven and Milwaukee, the Milwaukee, Lake Shore and Western, the Western Union, and the Wisconsin Central. It is drained by the Menomonee, Root, and Milwaukee rivers. Its surface is hilly, and the soil is very fertile, having a lower stratum of limestone. It produces grain and dairy products, and is adapted to stock-raising. It has manufactures of lumber and wool, machine shops, rolling mills, basket factories, etc. The Milwaukee river furnishes extensive water-power. Wheat is largely exported, and steamers cross the lake in every direction laden with its products and merchandise.

MILWAUKEE, a city of Wisconsin, on the western shore of lake Michigan, at the mouth of Milwaukee river or creek, which forms its harbor. The town, beautifully built with light yellow bricks, crowns a high bluff on the lake, and contains county buildings, custom-house, and post-office, 60 churches, public schools, female college, banks, insurance companies, asylums, hospital, and many daily and weekly papers. Several railways connect the city with a country of great fertility. In extent of marine commerce, Milwaukee ranks fourth among the cities of the union; and it has great advantages as a manufacturing center. The grain received at Milwaukee in 1873 amounted to 33,983,315 bushels. Pop. '60, 45,254; '70, 71,440.

MILWAUKEE (*ante*), the 19th city in population of the United States; pop. '80, 115,578. Lat. 43° 3′ 45″ n.; long. 87° 57′ w. It is 90 m. n. of Chicago, and 80 m. e. of Madison, on the Milwaukee, which flows into the lake from the n. and is navigable for 2 m. from its mouth. The Menomonee discharges into the Milwaukee about ½ m. from the mouth of the latter. The city harbor is 6 m. long and 3 m. wide, and has been extensively improved by the government, so as to be one of the best harbors on the lakes. The city lies on both sides of the river. Its streets are regular, and the architecture has a pleasing appearance, the most common building material being the cream-colored brick manufactured in the city. The business part of the city is in its center, near the rivers; the higher parts to the e. and w. are occupied by residences. The streets are lighted with gas, and well-paved, and there is a good sewage system. The county court-house is an elegant sandstone building, erected at a cost of over $400,000; the U. S. courts are held in the marble post-office, which is also used for a custom-house. The county jail and workhouse are here. There are 25 public and 50 private schools, a number of academies, an industrial school, 4 orphan asylums, and 2 hospitals. There is a college for women in the city, and a Franciscan college and Capuchin monastery in the suburbs. There is a public art gallery, a public library connected with the young men's association, and a German library and museum. There are 3 theaters, and 47 periodicals, of which 20 are in German; 7 are dailies. The city has 71 churches, a Roman Catholic and an Episcopal cathedral. The former is the seat of the archbishop. Milwaukee is the terminus of 6 railroads: the Chicago and Northwestern; Wisconsin Central; Western Union; Milwaukee, Lake Shore and Western; Detroit and Milwaukee; and Chicago, Milwaukee and St. Paul. It is the greatest wheat market in the world, and the port from which are shipped the agricultural products of the three great states of Wisconsin, Minnesota, and Iowa. The receipts of wheat in 1877 were 19,355,469 bush.; of flour, 1,905,454 bbls.; of oats, 1,550,263 bush.; of corn, 935,739 bush.; of barley, 2,444,454 bush.; of butter, 8,898,875 lbs.; of wool, 2,528,843 lbs.; of cheese, 8,289,701 lbs. The shipments of wheat for the same year were 18,204,253 bush., and of flour 2,286,786 bbls. There is storage for 6,000,000 bush. Another article of extensive export is lumber, of which 136,429,000 ft. were shipped in 1877, besides 177,189,000 shingles. The Milwaukee river furnishes an abundant water-power for manufacturing purposes. A dam 3 m. from its mouth brings the water up 12 ft. above high-water mark, and a canal 1¼ m. long, runs from this dam along the w. side of the river. Manufactories and mills are built along the canal, and their wares can be loaded directly into steamers without another transfer. The most important manufacturing establishments are the iron and rolling mills, with a capital of nearly $4,000,000, and employing over 2,000 men. There are 13 flouring mills with a capital of over $1,500,000. Over $3,000,000 is invested in the manufacture of beer, and $1,300,000 in the manufacture of leather. Large amounts are invested in the pork-packing business. Among the smaller manufactures are woolen cloth, boots and shoes, sashes and blinds, wagons, barrels, brooms, furniture, tobacco and cigars, soap and candles, paper, and white lead. There are 14 banks, and a number of insurance companies. The national asylum for invalid soldiers is about 3 m. from the city. It is a government institution, and contains some 600 soldiers. A line of steamers runs across the lake, connecting with the Detroit and Milwaukee railroad. The tonnage of vessels belonging to Milwaukee is nearly 70,000. Milwaukee has a very large German population, and many Scandinavians and Bohemians are settled there. It is divided into 13 wards, each of which elects 1 alderman and 2 common councilmen. The city is furnished with water from the lake. Its first white settler was a Frenchman named Jumeau, who came there in 1825 to engage in the fur-trade, and was afterward mayor. It was incorporated as a city in 1846.

MÎMÂNSA (from the Sanskrit *mân*, to investigate; hence, literally investigation) is the collective name of two of the six divisions of orthodox Hindu philosophy. See SANSKRIT LITERATURE. It is distinguished as *Pûrva-* and *Uttara-mîmânsâ*, the latter being more commonly called *Vedânta* (q.v.), while the former is briefly styled *Mîmânsâ*. Though the Mîmânsâ is ranked, by all native writers, with the five other philosophical systems, the term philosophy—as understood in a European sense—can scarcely be applied to it; for the Mîmânsâ is neither concerned with the nature of the absolute or of the human mind, nor with the various categories of existence in general—topics dealt with more or less by the other five philosophies; its object is merely to lay down a correct interpretation of such Vedic passages as refer to the Brâhmanic ritual, to solve doubts wherever they may exist on matters concerning sacrificial acts, and to reconcile discrepancies—according to the Mîmânsâ, always apparent only—of Vedic texts. The foundation of this system is

therefore preceded by a codification of the three principal Vedas—the Rik, Black-Yajus, and Sâman—and by the existence of schools and theories which, by their different interpretations of the Vedic rites, had begun to endanger, or, in reality, had endangered a correct, or at least authoritative understanding of the Vedic texts. It is the method, however, adopted by the Mîmânsâ which imparted to it a higher character than that of a mere commentary, and allowed it to be looked upon as a philosophy; for, in the first place, the topics explained by this system do not follow the order in which they occur in the Vedic writings, especially in the Brâhmana portion of the Vedas (q.v.); they are arranged according to certain categories, such as authoritativeness, indirect precept, concurrent efficacy, co-ordinate effect, etc.; and secondly, each topic or case is discussed according to a regular scheme, which comprises the proposition of the subject-matter, the doubt or question arising upon it, the *primâ-facie* or wrong argument applied to it, the correct argument in refutation of the latter, and the conclusion devolving from it. Some subjects treated of in the Mîmânsâ, incidentally as it were, and merely for the sake of argument, belong likewise more to the sphere of philosophic thought than to that of commentatorial criticism, such, for instance, as the association of articulate sound with sense, the similarity of words in different languages, the inspiration or eternity of the Veda, the invisible or spiritual operation of pious acts, etc. The reputed founder of this system is Jaimini—of unknown date—who taught it in twelve books, each subdivided into four chapters, except the third, sixth, and tenth books, which contain eight chapters each; the chapters, again, are divided into sections, generally comprising several Sûtras or aphorisms, but sometimes only one. The extant commentary on this obscure work is the *Bhâshya* of Sabaraswâmin, which was critically annotated by the great Mîmânsâ authority, Kumârila-swâmin. Out of these works, which, in their turn, quote several others, apparently lost, has arisen a great number of other writings, explaining and elucidating their predecessors. The best compendium amongst these modern works is the *Jaiminîya-nyâya-mâlâ-vistura*, by the celebrated Mâdhavâchârya (q.v.).

MIMES, the name given by the ancients to certain dramatic performances, in which, with little attempt at art, scenes of actual life were represented, sometimes in improvised dialogue. The Greek mimes appear to have been invented by the Greeks of Sicily and southern Italy. They were a favorite amusement of convivial parties, the guests themselves being generally the performers. Sophron of Syracuse, about 420 B.C., composed many in the Doric dialect, which were much admired, and which Plato was accustomed to read.—The Roman mimes were not borrowed from the Greek, but were of native Italic growth. They were not only far ruder and coarser, but in some respects they were essentially different—the dialogue occupying a smaller place, and mere gesture and mimicry predominating. The humor and satire, however, were often genuine, though rough, and even indecent, and they were greatly relished by all classes; even the patrician Sulla was fond of them.

MIMNER'MUS, B.C. about 635–600; b. probably at Colophon or Smyrna, but little is known of his life except as disclosed in his poems. As an elegiac poet he is spoken of by ancient critics with great admiration, but of his work only a few fragments remain. These are partly erotic, and in part treat of such subjects as the short-livedness of pleasure, fleeting youth, etc.; and all his topics are tinged with melancholy. He was the first to adapt the elegiac verse to this kind of composition. The best of his existing poems is *Nanno*, a love song to a young musician.

MIMO'SEÆ, a suborder of *leguminosæ*, one of the largest natural orders of exogenous plants; distinguished by regular flowers and petals valvate in bud. About 1000 species are known, all natives of warm climates, a few only extending beyond sub-tropical regions in the southern hemisphere. The genera *acacia* (q.v.) and *mimosa* are the best-known. To the latter genus belongs the sensitive plants (q.v.). Some of the larger species of mimoseæ are valuable timber trees. The TALHA (*mimosa ferruginea*) is one of the most common trees of central Africa. They are also trees of great beauty. Some species of the genus *prosopis*, natives of the western parts of South America, are remarkable for the abundance of tannin in their pods.

MIM'ULUS, a genus of plants of the natural order *scrophulariaceæ*, having a prismatic 5-toothed calyx, a somewhat bell-shaped corolla, of which the upper lip is bifid and the lower trifid, the lobes not very unequal, two long and two short stamens, and a stigma of two lamellæ, which close together upon irritation. The species are mostly herbaceous plants, natives of America. Some of them are very frequent in flower-gardens, and many fine varieties have resulted from cultivation. They sometimes receive the name of *monkey-flower*. One species, *M. luteus*, a native of Peru and Chili, has become naturalized in many parts of Britain. The little yellow-flowered MUSK PLANT, now so common in gardens and on window-sills in Britain, is *M. moschatus*, a native of Oregon and other north-western parts of America.

MI'NA, or **MNA,** the name of a Greek weight and money denomination, derived from an oriental word, *maneh*, signifying "weight." The mina contained 100 drachmæ (q.v.), and was the sixtieth part of a talent; consequently, as a *weight*, it was equivalent to about 1¼ of a pound avoirdupois, varying in different districts to the extent of one-

third of a pound more or less, following the fluctuations of the talent itself. As a *money of account*, it preserved the same relation to the talent, and was worth £4 1s 3d. See TALENT.

MINA, Don FRANCISCO ESPOZ Y., 1782–1836; b. Spain; first distinguished himself in 1809 by guerrilla warfare, organizing bands of mountaineers in Catalonia to repel the French invaders. In 1810 he became commander-in-chief of the Catalonian army, and noted for his incessant activity and remarkable presence of mind. In 1812 he was made commander in Aragon, with the rank of general, and assisted in gaining the victories of Salamanca and Vittoria, and conducted an efficient blockade of Pampeluna. Discovering, when peace was made, in 1814, that he had been laboring in the interest of the despotic policy of Ferdinand III., he made an ineffectual attempt to gain over the garrison of Pampeluna to the cause of freedom, and then sought an asylum in France. While resident in Paris he was arrested by a French commissary of police, employed by the Spanish ambassador. On this occasion Louis XVIII. acted with great magnanimity. He dismissed the commissary, demanded the recall of the Spanish ambassador, and not only released Mina but gave him a pension of 1000 francs. In 1822, when the army of Cadiz proclaimed the constitution of 1812, and began a new revolution, gen. Mina repaired to Navarre, where he learned that the king had accepted the new constitution, and accordingly ceased an aggressive movement which he had already undertaken. He was appointed capt.gen. of the armies of Navarre, Catalonia, and Aragon; but on Ferdinand recanting his assurance of adherence to the constitution, he again retired from Spain, and went to England. After the accession of Isabella II., under the regency of queen Christina, he became prominent in the operations against don Carlos; and on these ending, the charge of educating the young queen was allotted to gen. Mina and his wife.

MINA, XAVIER, 1789–1816; b. Spain; nephew of Francisco; educated for the priesthood. He was with his uncle in the guerrilla warfare of 1808–09, was taken prisoner in 1810, and detained four years at Vincennes. In 1814 he was again in arms, and forced to flee to France. Thence he went to England, where he interested himself in the cause of Mexican patriots struggling for independence, and by the aid of some prominent Englishmen chartered a vessel, purchased arms, organized an expedition, and sailed for America, arriving on the coast of Virginia in the summer of 1816, with his party. In the United States he received sympathy and substantial support, and took 200 volunteers with him, arriving at Galveston in November, but soon afterwards crossing over to New Orleans obtained more assistance, and after being reinforced by 100 Americans at Galveston, landed at Soto la Marina, province of Tamaulipas, April, 1817. He now marched at the head of 500 men towards the capital, fighting his way through such bodies of Spaniards as he met. He was successful in a number of engagements, but was at length surprised at night, captured, and put to death in front of the fortress of Remedios, Oct. 27, 1817.

MINA BIRD, *Eulabes Indicus* or *Gracula Indica*, a species of grakle (q.v.), or of a nearly allied genus, a native of many parts of the East Indies, about the size of a common thrush, of a deep velvety black color, with a white mark on the base of the quill-feathers of the wings, yellow bill and feet, and two large bright yellow wattles at the back of the head. The bill is large, conical; the upper mandible a little curved and sharp-pointed. The food of the mina bird consists of fruits and insects. It is very lively and intelligent, and possesses a power of imitating human speech excelled by none of the parrots. It has sometimes been trained to repeat sentences of considerable length. It is therefore in great request, and is often brought to Europe.—Another and larger species is found in Sumatra and some of the other eastern islands; possessing the same power of articulation. It is highly prized by the Javanese.

MINAMOTO, or GEN, the name of an ancient noble family in Japan, whose members for many centuries were military vassals of the mikados. Under the leadership of the Minamoto generals the whole of eastern and northern Japan, above the 36th parallel n. lat. was conquered, and the aboriginal tribes brought under the government of the imperial court at Kioto, and the brocade banner of the mikado was borne even into Yezo. The Minamoto family was founded by two grandsons of the 57th mikado, Seiwa, who reigned 859–76. From these princes, in two branches, have descended the hundreds of illustrious military characters whose names and exploits fill the annals of Japan. Among their living descendants are seventeen families of nobles of the imperial court, of whom are Iwakura, now premier, Ohara, Higashi, Kuze, and other prominent rulers. Their crest consists of three bamboo leaves surmounted by gentian flowers. See YORITOMO.

MINARET,—MINAR, a tall turret, used in Saracenic architecture. It contains a staircase, and is divided into several stories, with balconies from which the priests summon the Mohammedans to prayer—bells not being permitted in their religion—and is terminated with a spire or ornamental finial. The minarets are amongst the most beautiful features of Mohammedan architecture, and are an invariable accompaniment of the mosques (q.v.). In India, *minars*, or pillars of victory, are frequently erected in connection with mosques; some of these are lofty and splendid monuments, that of Kootub, at Old Delhi,

being 48 feet 4 in. in diameter at base, and about 250 feet high. They are often built on a plan of a star-like form, and are divided into stories by projecting balconies, like the minarets.

MINAS GERAES, an interior province in e. Brazil, bounded on the n. by Bahia, on the e. by Porto Seguro and Espiritu Santo, on the s. by Rio Janeiro and Sâo Paulo, and on the w. by Goyaz, 237,481 sq.m.; pop. '72, 2,039,735. It is an elevated table-land, intersected by many mountain chains, which send out offshoots in all directions. The highest peaks are Itambi, 5,950, and Itacolumi, 5,750 ft. above the level of the sea. Between the mountain ridges are sloping and well-watered valleys. There is an abundance of small streams, which flow into the Sâo Francisco, or the tributaries of the Parana. The Sâo Francisco rises in the s. of the province, flows through almost its entire length, forms the boundary line between Bahia and Pernambuco, and between Sergipe del Rei and Alagoas, and finally falls into the Atlantic ocean. The Doce and the Jequitinonha flow e. to the Atlantic, and the Rio Grande and Rio Parnahiba unite to form the Parano. Other rivers of importance are the Verde Grande, Paranahyba, Rio das Velhas, and Mucury. On account of its elevation the climate is much milder than that of districts within the same parallels of latitude. The soil is fertile, and produces the ordinary cereals of the temperate zones, besides the crops characteristic of a warmer climate, such as tobacco, cotton, sugar, coffee, and indigo. Ipecacuanha, manioc, and jalap are produced largely. The productions of the country are exported to the neighboring provinces, from which imports of wine, salt, and flour are made. The valleys between the mountains are used for grazing purposes, and cattle are raised in large numbers. The mines were formerly among the richest in Brazil, yielding large quantities of gold, but they are for the most part abandoned, though gold is still found in paying quantities. Diamonds were discovered in the province in 1746, and diamond-washing is extensively pursued. Other varieties of precious stones are found in the rivers. The mineral deposits are extensive, including, besides gold and silver, iron, lead, mercury, bismuth, antimony, alum, and sulphur. The want of railroads makes transportation, which is dependent on mules, difficult and expensive. Cotton and woolen manufactories, foundries, and other manufacturing industries have been introduced. Capital, Ouro Preto.

MINATITLAN, a t. on the isthmus of Tehuantepec, Mexico, 125 m. s.e. of Vera Cruz, on the w. side of the Coalzacoalcos. It is in a flat country, and is often exposed to floods. Mahogony grows in the region, and considerable is exported. This t. is the proposed terminus of the Tehuantepec ship canal and railroad.

MINCH, the channel which separates the island of Lewes from the counties of Cromarty and Ross, in the n.w. of Scotland. Its shores are exceedingly irregular, and its average width is about 28 miles. The *Little Minch*, which separates the island of Skye from that of North Uist and the neighboring islands in the outer Hebrides, is upwards of 15 m. in width.

MINCIO (anc. *Mincius*), a river of n. Italy, a continuation of the Tyrolese stream, the Sarca, emerges from lake Garda at Peschiera, and after a course of about 38 m. through the province of Mantua, which it separates from Verona, falls into the Po, 8 m. below the city of Mautua. The Mincio has constituted an important basis of operation during the wars between Italy and Austria.

MIND. Having adverted in various other articles—EMOTION, INTELLECT, WILL, etc.—to the chief component parts of our mental constitution, all that is necessary under the present head is to consider the definition or precise demarkation of mind as a whole. In this subject we cannot resort to the common method of defining, which is to assign something more simple and fundamental than the thing to be defined; as when we define gravity to be an *attractive force*, the notions of force and attraction being supposed to be more intelligible than gravity. Mind can be resolved into nothing more fundamental than itself; and therefore our plan must be to call attention to those individual facts or experiences that are pointed at by the name, and to circumscribe, in some way or other, the whole field of such experiences. For an example of mind, we should probably refer each person to his pleasures and pains, which are a class of things quite apart and peculiar; we should also indicate thoughts or ideas as mental elements; also exercises of will or voluntary action. There is a sufficient community of nature in those various elements to cause them to be classed by themselves under a common designation, namely, mind. If any one could be made aware of all the phenomena that have received this designation, he would, of course, know the meaning in the detail; but this is not enough. Mind being a general or comprehensive name, we ought to see distinctly the common character or attribute pervading all those particular phenomena; the recognition of this common character is the knowledge of mind in general, or the determination of its defining attribute. For the settling of this common attribute we have another great resource, besides comparing the individual facts, that is, to determine the opposite, or contrast of mind. Now, the usually assigned contrast is matter; but more precisely, it is extension, or *the extended*, including both inert matter and empty space. When we are conscious of anything as having the property of extension, our consciousness is occupied with the object world, or something that is not mind. When we are feeling pleasure or pain, remembering or willing, we are not conscious of anything extended; we are said to be

in a state of subjective consciousness, or to be exhibiting a phenomenon of mind proper. Hence, philosophers are accustomed to speak of the *inextended mind*, as distinguished from the outer or object world. In one sense everything that we can take cognizance of is mind or self; we cannot by any possibility transcend our own mental sphere; whatever we know is our own mind; hence the idealism of Berkeley, which seemed to annihilate the whole external universe. But this large sense of mind is not what is usually meant, and whatever view we take of the reality of the external world, we must never merge the distinction between the consciousness of the extended—which is also coupled with other truly object properties, as inertia, for matter—and the consciousness of the inextended, as constituting our feelings and thoughts. This opposition is fundamental and inerasable, and is expressed in language by a variety of designations—mind and not mind, subject and object, internal and external. The laws and phenomena of the extended are set forth in the sciences of the external world—mathematics, mechanics, chemistry, etc.; the laws of the mind proper, or the subject consciousness, are quite distinct in their nature, and are embodied in a separate science, called mental philosophy, psychology, etc.

MIND, GOTTFRIED, 1768–1814, b. Switzerland; educated at Pestalozzi's charity school. His education, however, except in the art of design, was extremely limited. He was naturally eccentric, and a deformity to which he was subject increased his peculiarities, and made him avoid society. He was fond of cats, his pictures of which are his most characteristic works. He was also successful in the delineation of children and beggars. He died poor, but some of his pictures have since been sold at very high rates.

MINDANA'O. See PHILIPPINE ISLANDS.

MINDEN, a Prussian t. in the province of Westphalia, lies on the Weser, is a prosperous, closely-built city, with a population of (1875) 17,088. It was till lately a fortress of the second class. Minden, which ranks as one of the oldest towns in Germany, has a stone bridge across the river, originally erected in 1518, and possesses several ancient churches, the most noteworthy of which is the present Roman Catholic church. Built in the second half of the 11th c. it was till 1811 an episcopal cathedral. A battle was fought near Minden in 1759, in which the French were defeated by an army of Anglo-Hanoverian troops.

The Hanoverian town of Minden or *Münden* is situated in the district of Hildesheim, within the province of Göttingen, and at the confluence of the Fulda and Werra. Pop. 75, 5,616. Minden lies in one of the most picturesque and fruitful parts of Hanover. It has 3 breweries, and manufactories of china, earthenware, sugar, tobacco, and linen, with a noted linen-market. There are alum-works and good coal-mines in the immediate neighborhood; and it has an extensive river transport-trade in millstones, corn, and timber. Minden possesses several architectural remains, indicative of its former more prosperous condition.

MINDORO. See PHILIPPINE ISLANDS, *ante.*

MIN'DSZENT, a t. of Hungary, in the county of Csongrad, near the left bank of the Theiss, and just below the mouth of the Saros, 19 m. north from Szegedin. Pop. '69, 9,414.

MINE. See MINES; MINING; *ante.*

MINE'O, a t. of the island of Sicily, in the province of Catania, 82 m. s.w. of Messina. It is supposed to occupy the site of the ancient *Menæ*, founded by Ducetius, 459 B.C. Pop. 9,500.

MINER, a co. in s.e. Dakota, drained by Sand Hill creek and Marsh creek, affluents of the Dakota river; about 504 sq. m.; pop. '80, 363–299 of American birth. It is principally slightly undulating prairie land, little cultivated, but with a soil of exceptional fertility.

MINER, ALONZO AMES, D.D., b. N. H. 1814; principal of the military and scientific academy at Unity, New Hampshire, 1835–39. In the latter year, he was ordained to the Universalist ministry. He has been pastor of Universalist churches at Methuen, Lowell, and Boston, an overseer of Harvard college, a member of the Massachusetts board of education, and president of Tuft's college, Medford, from 1862 to 1874, when he re-assumed the pastorate of the second Universalist church, Boston. He is an advocate of total abstinence, and has been the candidate of the "prohibitory" party for governor of Massachusetts. He was was also prominent in the antislavery agitation.

MINER, THOMAS, 1778–1841; b. Conn.; a graduate of Yale, and a physician who gained some distinction in his profession by the publication in 1825 of *Essays upon Yellow Fevers and other Medical Subjects* and a treatise on *Typhus Syncopalis.* He was also one of the founders of the Yale medical institute, and the Connecticut retreat for the insane. His autobiography was published in the *New Englander*, vol. ii.

MINERAL, a co. in n.e. West Virginia, having the n. branch of the Potomac river, the Baltimore and Ohio railroad, and a ridge of the Alleghany mts. for its w., n., and n.e. boundaries, separating it from the state of Maryland; 280 sq. m.; pop. '80, 8,629–8,170 of American birth, 486 colored. Its surface is mountainous with wide fertile valleys,

and is drained by Patterson's creek. The soil is adapted to the cultivation of grain and potatoes; its dairy products are considerable, and live stock is raised. Iron and bituminous coal are mined, and largely exported. The Chesapeake and Ohio canal follows the course of the river and the railroad on its n.e. border, and the Cumberland and Pennsylvania railroad terminates at Piedmont. Capital, Keyser.

MINERAL ACIDS, in medicine. The ordinary mineral acids are sulphuric (oil of vitriol), nitric (aqua fortis), hydrochloric (muriatic acid), phosphoric, chromic, and carbonic acids. Of these the latter only is usually regarded as a gas, that being its ordinary condition, but all the others are gases or vapors at certain temperatures, except phosphoric and chromic which on being heated change in composition. Concentrated sulphuric acid boils (in other words becomes a vapor) at 620° F., and concentrated nitric at 184° F. Hydrochloric acid is a solution of a gas in water, and has constantly varying degrees of strength. An aqueous solution boiling at 230° F. gives off a vapor which contains 20.22 per cent of anhydrous acid gas dissolved in 79.78 per cent of water, which may be condensed in a receiver. A more concentrated solution when heated yields at first only gas; as it gets weaker by parting with the gas, water begins to pass off along with it. These acids have various uses in medicine. Sulphuric, nitric, chromic, and hydrochloric acids in a concentrated state are powerfully corrosive, and on this account nitric acid is used in surgery as an escharotic, to destroy warts and other excrescences or diseased growths or unhealthy tissues. It has the property of only injuring the tissue as far as it destroys it, leaving a wound which heals easily. Sulphuric acid, on the contrary, produces an inflammation which does not readily subside, while hydrochloric acid used as an escharotic produces sloughing, sometimes of a dangerous character. Chromic acid which is ordinarily a crystalline solid of a beautiful crimson color is soluble in water, and its solution, of a proper strength, is also used as an escharotic in surgery, and is generally preferred to nitric acid, being rather more manageable. It is also used, in weaker solutions, as an application to the gums in scrofulous patients, when there is a tendency to ulceration, and in other ill-conditioned states of the system, and also as a styptic for arresting surface hemorrhage. It is not administered internally. Sulphuric acid in a diluted form is sometimes employed as a tonic, and its various salts are many of them valuable medicines. See sulphates in SULPHURIC ACID, *ante*. Dilute nitric acid is given as a medicine in several affections. It sometimes succeeds in intermittent fever when quinine is contra-indicated, and has been given in dysentery, on the recommendation of Hope. In some forms of dyspepsia and mal-assimilation it is useful in assisting digestion and improving nutrition. In combination with hydrochloric acid, in the form of diluted aqua-regia, it is often successfully used in cases of jaundice, and also in some forms of dyspepsia, hydrochloric acid being a natural ingredient of the gastric juice. Dilute nitric acid has been used with benefit in diabetes mellitus, and it is stated that in large doses, largely diluted in water, it has cured several cases of diabetes insipidus. It has also been successfully used in scrofula and glandular enlargements. See CARBONIC ACID, NITRIC ACID, HYDROCHLORIC ACID, and phosphoric acid in PHOSPHORUS.

MINERAL CHAMELEON. See MANGANESE.

MINERAL DEPOSITS. This term is generally understood as a collection of metalliferous ores occurring in geological formations where they have been deposited by the processes of nature, and have, with some exceptions, undergone more or less alteration, either in composition or position, by subsequent changes. Sometimes the ore is a native metal, but is more frequently a mixture of compounds of different metals. A single metal may be the principal one, the associated metals forming a mixture which is called a gangue, the principal ore and the gangue constituting the deposit. In general, ores may be classified as follows: compact, when the structure is close and fine-grained; granular, when composed of visible particles; micaceous or finely laminated, when existing in the form of minute scales, as, for example, micaceous specular iron ore; disseminated, when scattered throughout the gangue in laminæ or coarse grains; porphyritic, when distributed in distinct crystals; banded, when the principal ore, or the gangue, or both, are arranged in parallel layers, or bands. Sometimes the bands are arranged concentrically, when the deposit is said to be concentric-banded; brecciated, when the deposit contains fragments of other rock or of older ore, these fragments often forming nuclei around which the ore or the gangue has formed further deposits or crystals; and it is called drusy when there are many cavities lined with crystals. Mineral deposits may also be divided into superficial, stratified, and unstratified deposits. Superficial deposits are those in which the materials lie in a more or less unconsolidated or loose condition where they have been washed from cliffs and mountain slopes whose rocks contained metals, ores, or gems. The surface gold deposits of California, Australia, and the Ural are examples, as also the platinum beds of Oregon and Siberia, and the stream tin of Cornwall, Australia, and Durango, and the diamond, sapphire, and ruby "mines" of Brazil, South Africa, and the Indies. The ease with which such deposits are worked renders them as a rule the most profitable when first discovered. Stratified deposits have their examples in the coal beds, and many beds of iron, such as the clay iron-stone of the coal measures; and the schistose copper beds in the triassic sandstones of New Mexico. Unstratified deposits have their examples in those meta-

morphosed rocks which have been much disturbed by geologic forces, as the iron ores of Missouri, lake Superior, and the Alleghanies. These deposits were formerly supposed to be of eruptive origin, but it is now understood that they are principally stratified deposits which have been subjected to great disturbance and to metamorphism. The vast deposits of metallic copper in the lake Superior region were once supposed to have been formed from subterranean fusion, but it has been pretty clearly demonstrated that the metal was deposited from solution under the influence of galvanic or magnetic action. There are, however, eruptive rocks which contain minerals in disseminated condition, such as the volcanic rocks containing the amygdaloid copper of lake Superior, and the volcanic rocks in Japan, from which large quantities of copper are obtained. Among the unstratified deposits are what are called *contact* deposits. These occur at the junction, or surface of contact, of two different formations, as where sedimentary have been displaced by igneous rocks. Concretions and sheets of ore are thus found at the junction of trap and sandstone. Deposits occur also as *impregnations*, where the metalliferous mineral is diffused through a mass of rock in irregular streaks of more or less richness, as is generally the case with deposits of quicksilver. *Fahlbands* is a name given to deposits where the ore is diffused through certain layers which become more softened or rotten, or *fahl*, than the other strata. Examples of fahlbands are more frequently met with in mines in Scandinavia than elsewhere. *Stockwork* is a kind of deposit where the rock is penetrated in every direction, so that the ore must be taken out with the mass of the metalliferous rock. Some of the great iron ore deposits of the world, as the magnetic stock at Tagilsk in the Ural and the hematite of the Missouri iron mountain are examples, as also the copper mines of lake Superior, and the silver mines of Norway, Saxony, and Nevada.

Mineral veins are sheets of metalliferous matter, which are divided into three principal varieties—gash veins, segregated veins, and fissure veins. Gash veins are those which have been formed in fissures that have resulted from the shrinking of the rock, and are limited to one rock, generally to one bed. Examples are seen in the lead mines of the upper Mississippi, where the ore is confined to the Galena limestone, a lower Silurian formation. It usually occurs in vertical fissures of little depth, but sometimes in horizontal fissures, often opening into caves or chambers lined with ore; indeed, gash veins are often the commencements of cave formations. Segregated veins are those which are interposed between the strata, and always occur in metamorphic rocks, metamorphism being the cause of the segregation by the separation of the metalliferous materials from the masses of adjacent strata. They have not the banded character of the fissure veins (to be described), and are generally composed of quartz, often rich in gold. All the granitoid rocks of the Alleghanies are of this character, and contain more or less gold. Iron, and also copper, and less frequently nickel, are common associates. Fissure veins, true veins, or lodes, are formed in fissures which have been produced by volcanic or earthquake action. The displacements caused by these forces result in the formation of fissures because of the inability of the strata to return to their former relational position from the interposition of wedges of rock or other causes. The subsequent filling of the fissure by metalliferous material forms the vein or lode. As a consequence of the mode of formation, a fissure-vein is usually of unequal thickness, having the form of a wedge. They usually send out minor fissures, generally at acute angles, which are called branches, and sometimes feeders. The horizontal direction of a vein is called its strike or course, and is expressed by degrees of the quadrant in relation to points of the compass. The vertical angle which it makes with the horizon is called the dip. Geological disturbances are a frequent cause of displacement of parts of veins, forming what are called faults. The ores contained in fissure-veins are various, such as silver, copper, lead, tin, zinc, antimony, and other metals. Gold is less common than in segregated veins, and it is usually only worked in them as a side product. Silver is the most valuable constituent, and these veins constitute the great silver repositories of the world. The Comstock lode and various others in Nevada are examples. Various theories have been advanced to account for the filling of mineral veins. The earliest was the plutonic theory, which supposed that the materials were injected into the fissures in a state of fusion. An irresistible objection to this theory is that such a method would have necessitated the production of alloys to a much greater extent than is found to obtain. A later theory regarded the formation as the result of aqueous deposition, or sedimentation, in the manner of limestone and other sedimentary rocks. An overwhelming objection to this theory is the fact that veins are not horizontally stratified, but the materials are often deposited in vertical positions against the walls of the fissures. The theory of lateral secretion or transfusion has been proposed, which supposes that the contents of the fissures were derived by percolation through the walls of the veins from the adjacent rocks; but a fatal objection to this theory is the fact that the composition of a mineral vein is often the same throughout its extent, or in passing through various strata, whereas it ought to vary if the theory were true. Again, two veins of dissimilar constitution often traverse the same stratum adjacent to each other. This theory demands that they should be alike. The chemical precipitation theory regards the deposition as due to precipitation from superheated solutions under great pressure. These solutions, coming from subterranean sources, part with heat in passing into the fissures. The deposits made by thermal springs are instanced as affording illustrations of this mode of

production. Water containing salts of various kinds is capable, when under great pressure and at a high temperature, of dissolving most minerals; and if it came in contact with silicic acid charged with sulphur, many metals with which it came in contact in its passage through the fissures would be reduced to sulphides and deposited on cooling. Illustrations embracing the action of solutions of various saline and other bodies are carried to a greater or less extent in systematic works. Most mineral veins are more or less decomposed when situated at or near the surface, and, indeed, this condition usually extends downwards to the permanent water level, below which the ore is usually in its original state, which is, generally, a sulphide. In Cornwall the decomposed portion of a mineral vein is called a gossan, and this term is generally used among miners who speak the English language. In the gossan, silver ores are usually converted into chloride, bromide, etc., associated with various-shaped masses of native silver. Sulphide of copper is converted into oxides, and then into malachite, azurite, the green and blue carbonates, and into chrysocolla, the green hydrous silicate. On account of the disintegration which has taken place the gossan is more economically worked than that part of the vein which lies below the water level, and is in its natural state, and therefore the first workings of mineral veins are generally the most profitable.

MINERAL KINGDOM, the inorganic portion of nature. Under this term, however, are not included the inorganic products of organic beings, as sugar, resins, etc., although substances more remotely of vegetable or even animal origin are reckoned among minerals, as coal, fossils, etc. To the mineral kingdom belong liquid and gaseous, as well as solid substances; water, atmospheric air, etc., are included in it. All the chemical elements are found in the mineral kingdom, from which vegetable and animal organisms derive them; but many of the compounds which exist in nature belong entirely to the vegetable and animal kingdoms, and are produced by the wonderful chemistry of life.

MINERALOGY (Fr. *miner*, to dig, mine; Gael. *meinn;* Wel. *mwn*, ore, mine), the science which treats of minerals. But it does not embrace all that relates to the mineral kingdom. *Simple minerals* alone, or homogeneous mineral substances, are regarded as the subjects of mineralogy; rocks formed by the aggregation of simple minerals, and their relations to each other, are the subjects of geology (q.v.). This limitation of the term mineralogy is comparatively recent. Geology or geognosy was formerly included in it. The arrangement and description of simple minerals according to their external characters has been called by Werner and others *oryctognosy*, but the term has fortunately fallen into disuse. Nor is the study of mere external characters sufficient in mineralogy. The chemical composition of minerals equally demands attention. In the classification of minerals, some mineralogists, as Mohs and Jameson, have regarded only the external characters, and some, as Berzelius, only the chemical composition; but the results have been unsatisfactory, and the present tendency is in favor of a system which seeks to constitute natural groups by having regard to both.

Some minerals being of great use, and others highly valued for their beauty, have received much attention from the earliest ages. But the ancient naturalists describe few minerals. The first attempt at scientific mineralogy was by George Agricola in the 16th century. The systems of the Swedes Wallerius and Cronstedt, in the latter half of the 18th c., were the first worthy of the name. That of Werner followed, and was extensively adopted. The discoveries of Hauy in crystallography, and the progress of chemistry, gave mineralogy a new character; and then sprung up two schools of mineralogists, one resting chiefly on external characters, and the other on chemical composition.

The chemical classification of minerals is rendered difficult by the endless variety of combination and proportion in the elements of which they are composed, the presence of substances not essential to the mineral, and yet more or less affecting its characters, and the frequent impossibility of determining what is to be deemed essential, and what accidental. Chemical purity is almost never found in nature. Even the purest diamond, when burned, leaves some traces of ash; and the various colors of diamond, quartz, and other minerals are due to the presence of substances which are often in so small quantity as not to affect their crystalline forms or other physical properties. Again, some minerals of identical chemical composition differ in their crystallization, so that an arrangement founded upon it would separate them too widely. There are also many minerals which are often found in an uncrystallized state, and others which are always so. In the arrangement of minerals into natural groups, their chemical composition, although not alone to be regarded, is of the first importance, so that the place of a new mineral in the system can never be determined without analysis; and in determining the nature of a mineral, chemical tests, such as the application of acids, are continually resorted to. It is also necessary to know its specific gravity, and how it is acted upon both by a moderate heat and by the blowpipe. An examination of the crystalline forms, with measurement of the angles of the crystals, is often sufficient to distinguish minerals which have otherwise much resemblance. The *cleavage* of crystals is also important, a readiness to split in planes parallel to certain of their faces only, by which the *primitive form* of the crystal may be ascertained. Minerals not crystallized exhibit important varities of *structure*, as *laminated, fibrous, granular*, etc. Certain peculiarities of *form*

are also frequently characteristic of uncrystallized minerals, as *mamillary, botryoidal,* etc. Minerals exhibit, when broken, very different kinds of *fracture,* as *even, conchoidal, splintery,* etc. *Opaqueness, translucency,* and *transparency* are more or less characteristic of different kinds: *electric* and *magnetic* properties demand attention; and very important characters are derived from *luster,* which in some minerals is *metallic,* in others *semi-metallic,* in others *pearly, vitreous,* etc. *Color* is not generally of much importance, but in some minerals it very characteristic. *Hardness* and *tenacity* are very important, and are of all various degrees. A few fluid, and even a few gaseous substances, are included in mineralogical systems. *Unctuosity* and other peculiarities to be ascertained by the touch, are very characteristic of some minerals; peculiarities of *taste* and *smell* belong to others.

Mineralogy has very important relations with geology, which cannot be studied without regard to the mineral constituents of rocks. The mineral composition of soils greatly affects vegetation and agriculture. The economical uses of minerals are also very important and various. It is enough merely to allude to coal, lime, salt, and the metallic ores. Naphtha, petroleum, bitumen, asphalt, etc., are of well-known utility; and a high value has always been attached to gems and other ornamental stones.

MINERAL POINT, a city in s. Wisconsin, the n. terminus of the Mineral Point railroad a branch of the Illinois Central; pop. '70, 3,055. It is 45 m. w. of Madison, 180 m. from Chicago, 190 m. from Milwaukee, and 36 m. n.e. of Dubuque, Iowa. Large quantities of lead are taken from mines in the neighborhood, the surrounding country being a rich mineral region; and a vast amount of copper and lead is annually exported. It has zinc smelting furnaces, lead furnaces and foundries, 2 banks, a number of excellent public schools, a seminary, 6 churches, 2 hotels, 3 newspapers, and a car factory. It is a market for grain and general produce supplied by a tract of country 15 m. square.

MINERAL RESINS. See RESINS.

MINERAL TALLOW, or HATCHETINE, a remarkable substance found in several places in Britain, Germany, Siberia, etc., soft and flexible, yellowish white, or yellow, resembling wax or tallow, often flaky like spermaceti, inodorous, melting at 115°–170° F., and composed of about 86 carbon and 14 hydrogen.

MINERAL WATERS. This term is usually applied to all spring waters which possess qualities in relation to the animal body different from those of ordinary water. Mineral waters have been used as remedial agents from a very early period. The oldest Greek physicians had great faith in their curative power, and the temples erected to Æsculapius were usually in close proximity to mineral springs; they had recourse to the sulphurous thermal springs of Tiberias (now Tabareah), which are still used by patients from all parts of Syria in cases of painful tumor, rheumatism, gout, palsy, etc., and to the warm baths of Calirrhoe, near the Dead sea, which are mentioned by Josephus as having been tried by Herod in his sickness. We are indebted to the Romans for the discovery not only of the mineral thermic springs in Italy, but of some of the most important in other parts of Europe, amongst which may be named Aix-la-Chapelle, Baden-Baden, Bath, Spa in Belgium, and many others; and Pliny, in his *Natural History,* mentions a very large number of mineral springs in almost all parts of Europe.

The therapeutic action of mineral waters, or of spas, as they are frequently termed, depends chiefly upon their chemical composition and their temperature, although a variety of other circumstances, as situation, elevation, climate, geological formation, mean temperature, etc., have an important bearing upon the success of the treatment.

The best time for undergoing a course of mineral waters is, in the majority of cases, the months of June, July, August, and September. There are, however, exceptions depending upon climate; for example, at Gastein, celebrated for its thermal springs, the weather is changeable and stormy in June and July, but pleasant in May, August, and September. Early rising is usually advisable during a course of mineral waters, and, as a general rule, the water should be drunk before breakfast, at intervals of about a quarter of an hour between each tumbler, moderate exercise being taken in the intervals. In many cases bathing is of even greater importance as a remedial agent than drinking. Baths are generally taken between breakfast and dinner; and should never be taken soon after a full meal. The time during which the patient should remain in the bath varies very much at different spas, and the directions of the local physician should be strictly attended to on this point. It is impossible to determine beforehand how long a course of mineral waters should be continued, as this entirely depends upon the symptoms observed during treatment. As a general rule the treatment should not be protracted beyond the space of six weeks or two months, but on this point the patient must be solely guided by the physician resident at the spa. It cannot be too forcibly impressed upon the patient that indulgence in the pleasures of the table, and excesses of any kind, frequently counteract the salutary effects of the waters, while perfect mental relaxation is an important auxiliary to the treatment. It will be seen from remarks on the nature of the cases likely to receive benefit from the various kinds of mineral waters that spas are only suitable for patients suffering from *chronic disorders.*

No classification of mineral waters based upon their chemical composition can be

strictly exact, because many springs are, as it were, intermediate between tolerably well characterized groups. The following classification, which is adopted by Dr. Althaus, in his *Spas of Europe* (Lond. 1862), is perhaps the most convenient: 1. Alkaline waters; 2. Bitter waters; 3. Muriated waters; 4. Earthy waters; 5. Indifferent thermal waters; 6. Chalybeates; 7. Sulphurous waters.

1. The alkaline waters are divisible into (*a*) *Simple alkaline acidulous waters*, of which the chief contents are carbonic acid and bicarbonate of soda. The most important spas of this class are the thermal springs of Vichy and the cold springs of Fachingen, Geilnau, and Bilin. These waters are useful in certain forms of indigestion, in jaundice arising from catarrh of the hepatic ducts, in gall-stones, in renal calculi and gravel, in gout, in chronic catarrh of the respiratory organs, and in abdominal plethora. Vichy (q.v.) may be taken as the representative of this class of springs. (*b*) *Muriated alkaline acidulous waters*, which differ from the preceding sub-group in additionally containing a considerable quantity of chloride of sodium. The most important spas of this kind are the thermal springs of Ems, and the cold springs of Selters, Luhatschowitz, and Salzbrunn. They are useful in chronic catarrhal affections of the bronchial tubes, the stomach, and the intestines, and the larynx; and the Ems waters possess a high reputation in certain chronic diseases of the womb and adjacent organs. (*c*) *Alkaline saline waters*, of which the chief contents are sulphate and bicarbonate of soda. The most frequented of these spas are the warm springs of Carlsbad and the cold springs of Marienbad. Patients suffering from abdominal plethora are those most frequently sent to these spas, which often prove of great service if the stagnation of the blood is owing to habitual constipation, pressure from accumulated fæces, or congestion of the liver, unconnected with diseases of the heart or lungs. These waters, especially those of Carlsbad, afford an excellent remedy for the habitual constipation which so frequently arises from sedentary occupations; the result being much more permanent than that produced by strong purgative waters.

2. The chief contents of the bitter waters are the sulphates of magnesia and soda; and the best-known spas of this class are those of Püllna, Saidschütz, Sedlitz, Friedrichshall, and Kissingen; although there are two English spas—namely, the bitter water of Cherry Rock, near Kingswood, in Gloucestershire, and the Purton spa, near Swindon, in Wiltshire—which "are, by their chemical composition, admirably suited for the treatment of many cases of disease, and may perhaps even prove superior to the continental spas of this class."—Althaus, *op. cit.* p. 360. These waters act both as purgatives and diuretics, and may therefore be used advantageously in the numerous cases in which it is advisable to excite the action both of the bowels and kidneys.

3. The muriated waters are divisible into (*a*) *Simple muriated waters*, of which the chief contents are a moderate quantity of chloride of sodium, or common salt. The chief spas of this class are Wiesbaden and Baden-Baden, which are hot; those of Soden (in Nassau), of Mondorf (near Luxembourg), and of Canstatt (near Stuttgart), which are tepid; and those of Kissingen, Homburg, and Cheltenham, which are cold. They are chiefly employed in cases of gout, rheumatism, scrofula, and abdominal plethora. (*b*) *Muriated lithia waters*, of which the chief contents are the chlorides of sodium and lithium. The discovery of lithia in some of the Baden-Baden springs is so recent that there is as yet no sufficient experience concerning their therapeutic action. In gout they first aggravate the pain, but then give relief; and in periodic headache they have been found serviceable. (*c*) *Brines*, whose chief contents are a large amount of chloride of sodium. Amongst the spas of this kind those of Rehme, in Westphalia, and Nauheim, in Hesse, have the greatest reputation. They are mostly employed for bathing, and are often of much service in scrofula, anæmia, rheumatism, certain forms of paralysis, and catarrh of the mucous membranes. (*d*) *Iodo-bromated muriated waters*, in which, besides a moderate quantity of chloride of sodium, the iodides and bromides of sodium and magnesium are contained in an appreciable quantity. Kreuznach is the most celebrated of the spas of this class. Its waters are used both for drinking and bathing, and are of service in scrofulous infiltrations of the glands, in scrofulous ulcers, in chronic inflammation of the uterus and ovaries, etc. The waters of Hall, in Austria proper, are also of this class, and have a high reputation in cases of bronchocele or goiter.

4. Earthy waters, of which the chief contents are sulphate and carbonate of lime. The most important waters of this class occur at Wildungen, Leuk, Bath, Lucca, and Pisa. The Wildungen water, which is exported in large quantities, is, according to Dr. Althaus, "a capital diuretic, and not only promotes the elimination of gravel and renal calculi, but by its tonic action on the mucous membrane of the urinary passages serves to prevent the formation of fresh concretions. It is also much used for chronic catarrh of the bladder, neuralgia of the urethra and neck of the bladder, dysuria, and incontinence of urine." The baths of Leuk, in which many patients remain nine hours daily (viz., from 4 A.M. to 10 A.M., and from 2 P.M. to 5 P.M.), until an eruption appears, are chiefly used in chronic skin diseases. The waters of Bath, Pisa, and Lucca, which are thermal, are useful in chronic skin diseases, scrofula, gout, rheumatism, etc.

5. Indifferent thermal waters, which usually contain a small amount of saline constituents. Of the spas of this class, the most important are Gastein (95° to 118°), Töplitz (120°), Wildbad (96°), Warmbrunn (100°), Clifton (86°), and Buxton (82°). Their most

striking effects are to stimulate the skin and excite the nervous system. "They are especially used in chronic rheumatism and atonic gout; in diseases of the skin, such as prurigo, psoriasis, lichen; in neuralgia and paralysis due to rheumatic and gouty exudations, to parturition, or to severe diseases, such as typhoid fever and diphtheria; in hysteria; and in general weakness and marasmus."—Althaus, *op. cit.* p. 421.

6. Chalybeate waters, which are divisible into (*a*) *Simple acidulous chalybeates*, whose chief contents are carbonic acid and bicarbonate of protoxide of iron; and (*b*) *Saline acidulous chalybeates*, whose chief contents are sulphate of soda and bicarbonate of protoxide of iron. These waters are considered in a special article. See CHALYBEATE WATERS.

7. Sulphurous waters, which contain sulphureted hydrogen or metallic sulphides (sulphurets), or both. The most important sulphurous thermals are those of Aix-la-Chapelle, Baden (near Vienna), Baréges, Eaux-Chaudes, and Bagnères de Luchon; whilst among the cold sulphurous springs, those of Nenndorf (in Hessen-Nassau) and Harrogate are of great importance. They are extensively used in chronic diseases of the skin, and are of service in many cases in which exudations require to be absorbed, as in swellings of the joints, in old gunshot-wounds, and in chronic gout and rheumatism. In chronic laryngeal and bronchial catarrh, they frequently give relief, and in chronic poisoning by lead or mercury, they favor the elimination of the poison, although to a far less degree than iodide of potassium taken internally. The sulphurous waters are employed externally and internally, and mineral mud-baths are believed by many physicians to form a valuable auxiliary to this treatment.

For further information on this subject, the reader is referred to the work of Dr. Althaus (of which free use has been made in this article), and to the *Dictionnaire Général des Eaux Minérales et d'hydrologie Médicale* of MM. Durand-Fardel, Le Bret, and Lefort.

MINERAL WATERS, ARTIFICIAL. See AËRATED WATERS, *ante*.

MINERSVILLE, a borough in e. Pennsylvania, on a branch of the Philadelphia and Reading railroad at its junction with the Schuylkill Haven and Mine Hill railroad, and the terminus of the People's railway to Mount Carbon; pop. '70, 3,699. It is on the West Branch of the Schuylkill river, in the center of the anthracite coal mining region, not far from Broad mountain, 46 m. n.e. of Harrisburg, and 4 m. w. of Pottsville, in the southern or Schuylkill coal field. Other mineral deposits are sandstone, shale, and limestone. It is in a valley surrounded by hills seamed with iron ore and covered with the rough and dangerous apparatus of anthracite coal mining. It has a newspaper, 10 churches, a public library, water works, a well-organized fire department; there are machine shops and iron foundries, an anthracite furnace, a car factory, soap and shoe factories, and flour and saw mills.

MINERVA, the name of a Roman goddess, identified by the later Græcising Romans with the Greek *Athene*, whom she greatly resembled, though, like all the old Latin divinities, there was nothing anthropomorphic in what was told concerning her. Her name is thought to spring from the same root as *mens* (the mind) and *monēre* (to warn or advise); and the ancient Latin scholar and critic, Varro, regarded her as the impersonation of divine thought—the plan of the material universe of which Jupiter was the creator, and Juno the representative. Hence all that goes on among men, all that constitutes the development of human destiny (which is but the expression of the divine idea or intention), is under her care. She is the patroness of arts and trades; and was invoked alike by poets, painters, teachers, physicians, and all kinds of craftsmen. She also guides heroes in war; and, in fact, every wise idea, every bold act, and every useful design, owes something to the high inspiration of this virgin goddess. Her oldest temple at Rome was that on the Capitol, but she had another on the Aventine. Her festival was held in March, and lasted five days, from the 19th to the 23d inclusive.

ATHENE, or PALLAS ATHENE, the Greek goddess corresponding, as we have said, to the Roman Minerva, was one of the few truly grand *ethical* divinities of Greek mythology. Different accounts are given of her origin and parentage, probably from the jumbling together of local legends; but the best known, and in ancient times, the most orthodox version of the myth represented her as the daughter of Zeus and Metis. Zeus, we are told, when he had attained supreme power after his victory over the Titans, chose for his first wife Metis (Wisdom); but being advised by both Uranus and Gæa (Heaven and Earth), he swallowed her, when she was pregnant with Athene. When the time came that Athene should have been born, Zeus felt great pains in his head, and caused Hephæstus (Vulcan) to split it up with an axe, when the goddess sprang forth—fully armed, according to the later stories. Throwing aside the thick veil of anthropomorphism which conceals the significance of the myth, we may see in this account of Athene's parentage an effort to set forth a divine symbol of the combination of power and wisdom. Her father was the greatest, her mother the wisest of the gods. She is literally born of both, and so their qualities harmoniously blend in her. It is possible that the constant representation of her as a strictly maiden goddess, who had a *real*, and not a merely *prudish* antipathy to marriage, was meant to indicate that qualities like hers could not be mated, and that, because she was perfect, she was doomed to virginity. She was not, however, a cold unfeeling divinity; on the contrary, she warmly and

actively interested herself in the affairs of both gods and men. She sat at the right hand of Zeus, assisting him with her counsels; she helped him in his wars, and conquered Pallas and Encelados in the battles of the giants. She was the patroness of agriculture, invented the plow and rake, introduced the olive into Attica, and (in harmony with her character as the personification of active wisdom) taught men the use of almost all the implements of industry and art; and is said to have devised nearly all feminine employments. Philosophy, poetry, and oratory were also under her care. She was the protectress of the Athenian state, was believed to have instituted the court of justice on Mars' Hill (the Areiopagus). As a warlike divinity, she was thought to approve of those wars only which were undertaken for the public good, and conducted with prudence; and thus she was regarded as the protectress in battle of those heroes who were distinguished as well for their wisdom as their valor. In the Trojan wars, she favored the Greeks—who, in point of fact, were in the right. Her worship was universal in Greece, and representations of her in statues, busts, coins, reliefs, and vase-paintings were and are numerous. She is always dressed, generally in a Spartan tunic, with a cloak over it, and wears a helmet, beautifully adorned with figures of different animals, the ægis, the round Argolic shield, a lance, etc. Her countenance is beautiful, earnest, and thoughtful, and the whole figure majestic.

MINERVI'NO, a t. of southern Italy, in the province of Bari, called the *Balcony of Puglia*, from the extensive view it commands of several cities. It stands on a fine hill, and enjoys excellent air. Pop. 13,800.

MINES, in law. In England and Ireland the crown has the right to all mines of gold and silver; but where these metals are found in mines of tin, copper, iron, or other baser metal, then the crown has only the right to take the ore at a price fixed by statute. As a general rule, whoever is the owner of freehold land has a right to all the mines underneath the surface, for his absolute ownership extends to the center of the earth. When the land is given by will or otherwise to a tenant for life, while a third party has the reversion, then the tenant for life is held to be entitled not to open mines which have never before been opened, but to carry on such as have been open, and are going mines. So in the case of a lease of lands for agricultural purposes, if nothing is said as to mines, the tenant is not entitled to open any mines, for that would be committing waste. It is not uncommon for one person to be owner of the surface of the land and another to be owner of the mines beneath; or several persons may be owners of different kinds of mines lying above each other in the different strata. Many questions have been raised lately between railway companies and mine-owners as to their respective rights and liabilities. When a railway passes through a mining country it is generally optional with the owner to sell to the company merely the surface of the lands, reserving to himself the mines beneath; and it is usually provided that, if ever the owner work his mines so near to the railway as to endanger its stability, the company must have notice of that fact, and then, if necessary, may purchase the mines immediately under the railway. But the courts have determined that even though the owner of the land reserve his right to minerals, he is nevertheless prevented, by common law, from working the mines immediately under the railway, so as to endanger the use of the railway. In these matters the law of Scotland does not at all differ, though, as to other points of the common law, some differences of no great importance occur. See Paterson's *Compendium of English and Scottish Law*.

The practical working of mines and collieries in any part of Great Britain has been controlled by certain recent acts of parliament, with a view to insure the greater safety of the persons working them, and to prevent the employment of women and children. Thus, the owners of mines are prohibited, by the mines regulation acts, 1872 (repealing prior acts), from employing any female or boy under 10 underground. Boys under 16 can only be so employed ten hours per day, and boys under 12 must attend school at certain times. No owner or worker of a mine or colliery is allowed to pay the wages of the men at any tavern, public-house, beer-shop, or place of entertainment, or any office or outhouse connected therewith. No person under 18 is to be employed at the entrance of any mine, to have charge of the steam-engine or windlass, or other machinery and tackle for letting down and bringing up the men. Inspectors are appointed by government for the express purpose of visiting mines, and seeing that the statutes are complied with. The statutes in question now apply not only to coal-mines and collieries, but to metalliferous mines of all kinds. Whenever an inspector, on examination, finds anything dangerous or defective in the mine, he is bound to give notice to the owner, so that it may be amended. In case of accidents occurring in the mine, caused by explosion, and resulting in loss of life or bodily injury, the owner is bound, within twenty-four hours thereafter, to send notice to the secretary of state, and to the district inspector of mines, specifying the probable cause of the accident.

MINES, MILITARY, constitute at once one of the most important departments in military engineering, and a very formidable accessory both in the attack and defense of fortresses. A military mine consists of a gallery of greater or less length, run from some point of safety under an opposing work, or under an area over which an attacking force must pass, and terminating in a chamber which, being stored with gunpowder, can be exploded at the critical moment. Mines are of great use to the besiegers in the overthrow

of ramparts and formation of a breach; the *countermines* of the besieged in undermining the glacis over which the assaulting column must charge, and blowing them into the air, or in destroying batteries erected for breaching, are equally serviceable. But far above the actual mischief wrought by the mine—often very great—is its moral influence on the troops, and especially on the assailants. The bravest soldiers, who advance without flinching to the very mouth of the cannon *which they see*, will hesitate to cross ground which they suppose to be undermined, and on which they may be dashed to destruction in a moment, without the power of averting the *unseen* danger. The first employment of mines was very ancient, and merely consisted in obtaining an entrance to the interior of towns by passing beneath the defenses; but this soon fell into disuse, the chances of success being merely those of introducing a body of men before the besieged discovered the mine. The next use occurred during the middle ages, and was more destructive. The miners went no further than beneath the wall, then diverged to either side, and undermined the wall, say for about 100 feet. During the process, the wall was sustained by timber-props; and these being ultimately set on fire, the wall fell; and the besiegers, who had awaited the opportunity, rushed in at the breach. This use of mines of *attack* necessitated those of *defense*, which obtained in mediæval times and have ever since kept the name of "*countermines*." The earliest subterranean defense consisted of a gallery surrounding the fort in advance of the foot of the wall, and termed an "envelope-gallery." From this the garrison would push forward small branches or tributary galleries, whence they could obtain warning of the approach of hostile miners, and by which they succeeded, at times, in overthrowing the battering-rams or towers of the besiegers.

Two centuries appear to have elapsed between the introduction of gunpowder into European warfare and its application to subterranean operations. The first instance of this occurred in 1503, at the siege of the Castello del' Uovo, in the bay of Naples, which a French garrison had succeeded in holding for three years against the combined Spanish and Neapolitan forces. At length, a Spanish capt., Pedro Navarro, devised a gallery into the rock, which he stored with powder, whereof the explosion, hurling portions of the rock and many of the besieged into the sea, caused the immediate capture of the place. At once the use of mines of attack spread throughout Europe; and so irresistible were they soon considered, that it was not unusual for the besieger, after preparing his mine, to invite the besieged to inspect it, with the view of inducing the latter at once to surrender. Defense soon availed itself of the new power, and, retaining the envelope-gallery as a base, ran small countermines in many directions, to ascertain by hearing the approach of the enemy's sappers—his work being audible, to a practiced ear, at a horizontal distance of 60 feet. Small charges were then exploded, which, without creating surface disturbance, blew in the approaching gallery, and buried the sappers in its ruins. Thus commenced a system of subterranean warfare, requiring the greatest risk and courage, in which the operator was in constant danger of being suffocated. Of course, in such a system, the balance of advantage lay with the besieged, who had ample opportunities before the siege commenced, of completing his ramifications in every direction, and, if desirable, of revetting them with masonry, which much diminished the chance of being blown in; while the assailant, no longer able to cross the glacis by an open zigzag trench, was compelled to engage in a most uncertain subterranean advance. The French engineer, Belidor, in the 18th c., restored the advantage to the attack, by demonstrating that the explosion of a very large mass of powder in a mine which had not yet entered the labyrinth of defensive mines, effected the destruction of the latter for a great space round, clearing the way with certainty for the hostile advance. Although the primary purpose of a mine is the explosion of a charge of powder, they are often used as a means of communication between different works, or between different parts of the same work, some being constructed of size sufficient to permit the passage of four men abreast, of horses, and of artillery.

It is, of course, impossible, in such a work as this, to give even an outline of the professional part of military mining; but the article would be incomplete without some allusion to the main principles.

Mines are either vertical—when they are called *shafts*—horizantal, or inclined, in either of which cases, they are "galleries," the word "ascending" or "descending" being added if there be inclination. The dimensions range from the "great gallery," 6 ft. 6 in. by 7 ft., to the "small branch"—the last diminutive of the gallery—which has but 2 ft. 6 in. height, with a breadth of 2 feet. The most frequent work is the "common gallery," 4 ft. 6 in. by 3 ft., which is considered the easiest for the miner.

The sapper's tools are numerous, but most in request are his shovel, pickaxe, and, above all, his "push-pick:" he has besides a barrow, a small wagon, a lamp, and other accessories. As he advances, it is necessary to line his gallery, always at the top, and almost always at the sides. This he does either by frames—which resemble door-frames, and serve to retain horizontal planks or "sheeting" in position against the earth—or by cases somewhat resembling packing-cases, of little depth, which are used to form the sides and top. With cases, galleries are supposed to advance one foot and a half per hour; while with frames, the progress is barely more than half that amount.

When a mine is exploded, the circular opening on the surface is called the *crater*; the *line of least resistance* is the perpendicular from the charge to the surface; the half-

diameter of the crater is its radius; and the *radius of explosion* is a line from the charge to the edge of the crater, on the hypothenuse of the triangle, the revolution of which would form the cone. When the diameter equals the line of least resistance, the crater is called a one-lined crater; when it doubles that line, a two-lined crater; and so on. The common mine for ordinary operations is the two-lined crater; and for this the charge of powder should—in ground of average weight and tenacity—be in pounds a number equal to one-tenth of the cube of the line of least resistance in feet, for example, at a depth of 18 ft., the charge should consist of 583 pounds. In surcharged mines, or globes of compression, as introduced by Belidor, vastly greater charges are employed, and craters of six lines are sometimes produced. The rules, in these cases, for computing the charges vary exceedingly, according to different engineers, and in every case are very complicated. Previous to the explosion, the gallery is filled up behind the charge, or *tamped*, with earth, sand-bags, etc., to prevent the force of the powder wasting itself in the mine. This tamping must extend backwards for one and a half or twice the length of the line of least resistance. The mine is commonly fired by means of a powder-hose, composed of strong linen, inclosed in a wooden pipe laid carefully through the tamping, or by wires from a voltaic battery.

In the system of countermines the magistral gallery is immediately within the wall of the counterscarp, through orifices in which it derives light and air, and by its loopholes, the defenders can take in rear any enemy who might obtain momentary possession of the ditch. Further in advance, and reached by galleries of communication is the envelope-gallery from which radiate the listeners. To prevent the enemy's advances, these listeners should not be more than about 54 feet apart. Besides listening, they are used for aggressive purposes, such as driving branches and blowing in or up hostile works. Modern engineers object to the envelope-gallery, as affording too good a base to the enemy, should he obtain possession of it; and either dispense with it altogether, or merely retain it in short sections. At suitable points among the mines, small magazines for tools and powder are formed; and at about every 30 yards, loopholed doors of great strength are made, to stop the advance of an enemy, should he break into the galleries.

In the course of their excavations, hostile miners frequently meet, or approach within a few feet. It becomes, then, merely a question of time which shall destroy the other; shells, pistols, pikes, and petards, as well as small mines, being used with murderous effect.

Provision is made for pumping foul air out of mines; but such military works are in general badly ventilated.

MINGHETTI, Cavaliere Marco, a distinguished Italian writer and statesman, and for a time prime minister of Italy, was born at Bologna, on Nov. 8, 1818. He belonged to an opulent commercial family, and on the termination of his studies, entered on an extensive continental tour, with the object of closely investigating the political, social, and economical institutions of France, Germany, and more especially of Britain. On his return from traveling, he published his maiden essay, inculcating the great commercial advantages of free trade, as existing in England, and espousing with warmth the economical views of Richard Cobden. In 1846 Minghetti opened his political career by starting a journal of liberal tendencies, soon after the advent of Pius IX. to power; in 1847 he was elected member of the *Consulta delle Finanze*, and in 1848 became minister of public works. Having speedily lost faith in papal progression, Minghetti withdrew from office, and joined the army of Charles Albert in Lombardy, where he was warmly received by the king, and appointed captain. After the battle of Goito he was promoted major; and for his bravery in the engagement of Custoza, he received from the king the cross of the knights of St. Maurizio. On the conclusion of the war, Minghetti resumed his study of political economy, and gained the confidence of Cavour, by whom he was consulted during the conferences of Paris. He subsequently became secretary for foreign affairs, and only resigned with Cavour on the peace of Villafranca. Minghetti became minister of the interior in 1860, and premier in 1863. On leaving the ministry, he went as ambassador to London in 1868, and was subsequently, for a short time, minister of agriculture. In 1873 he became premier of a new ministry. His chief work is *Della Economia pubblica e delle sue Attinenze con la morale, e Col diritto* (1859).

MINGRE'LIA, the name of a division of Russia in Asia, on the Black sea; partly bounded by Circassia; 2,600 sq.m.; pop., 240,000. It is a rugged, mountainous country, but, in the southern part, fertile slopes lie along the river Rion, the most important stream in this part of Russia. Extensive forests of valuable timber cover the mountains, and there are mines of copper, some of which are worked; gold has also been found The country is peopled by Georgians; not, however, of as fine a type as those who inhabit the Caucasus. It was formerly a part of Georgia, and, at a later period, was ruled by native princes; one of whom, in 1867, ceded his rights to Russia, on being paid the sum of 1,000,000 roubles. Mingrelia was the ancient Colchis, where was the mythical golden fleece, in pursuit of which occurred the expedition of the Argonauts (q.v.). It was also the birth-place of Medea. The productions are tobacco, maize, rice, wool, honey, and wine. Silk is manufactured to some extent.

MINHO. See Entre Douro e Minho

MINHO (Span. *Miño*, anc. *Minius*), a river of Spain and Portugal, rises in the n.e. of Galicia, in lat. about 43° 20′ n., long. about 7° 15′ w. Its course is s.w. through the modern Spanish provinces of Lugo and Orense, after which, continuing its course, and forming the northern boundary of the Portuguese province of Minho, it falls into the Atlantic Ocean. Its length, exclusive of windings, is 130 m., and it is navigable for small craft 23 m. above its mouth.

MINIATURE-PAINTING, or the painting of portraits on a small scale, originated in the practice of embellishing manuscript books. See MANUSCRIPTS, ILLUMINATION OF. As the initial letters were written with red lead (Lat. *minium*), the art of illumination was expressed by the low-Latin verb *miniare*, and the term *miniatura* was applied to the small pictures introduced. After the invention of printing and engraving, this delicate art entered on a new phase; copies, in small dimensions, of celebrated pictures came to be in considerable request, and, in particular, there arose such a demand for miniature-portraits that a miniature, in popular language, is held to signify "a very small portrait." Soon after their introduction, miniature-portraits were executed with very great skill in England. Holbein (b. 1498, d. 1554) painted exquisite miniatures, and having settled in London, his works had great influence in calling forth native talent. The works of Nicholas Hilliard (b. at Exeter 1547, d. 1619) are justly held in high estimation. Isaac Oliver (b. 1556, d. 1617) was employed by queen Elizabeth and most of the distinguished characters of the time; his works are remarkable for careful and elaborate execution; and his son, Peter Oliver, achieved even a higher reputation. Thomas Flatman (b. 1633, d. 1688) painted good miniatures. Samuel Cooper (b. London 1609, d. 1672), who was, with his brother Alexander, a pupil of his uncle, Hoskins, an artist of reputation, carried miniature-painting to high excellence. Cromwell and Milton sat to him—he was employed by Charles II.—and obtained the highest patronage at the courts of France and in Holland. Till within these few years miniature-painting continued to be successfully cultivated in Britain; but it has received a severe check since photography was invented, and most of the artists of the present time who exercised their talents in this exquisite art have left it for other branches of painting. As to technical details, the early artists painted on vellum, and used body-colors, that is, colors mixed with white or other opaque pigments, and this practice was continued till a comparatively late period, when thin leaves of ivory, fixed on card-board with gum, were substituted. Many of the old miniature-painters worked with oil-colors on small plates of copper or silver. After ivory was substituted for vellum transparent colors were employed on faces, hands, and other delicate portions of the picture, the opaque colors being only used in draperies and the like; but during the present century, in which the art has been brought to the highest excellence, the practice has been to execute the entire work, with the exception of the high lights in white drapery, with transparent colors. In working the general practice is to draw the picture very faintly and delicately with a sable-hair pencil, using a neutral tint composed of cobalt and burned sienna. The features are carefully made out in that way, and then the carnations, or flesh-tints, composed of pink, madder, and raw sienna, gradually introduced. The drapery and background should be freely washed in, and the whole work is then brought out by hatching, that is, by painting with lines or strokes, which the artist must accommodate to the forms, and which are diminished in size as the work progresses. Stippling, or dotting, was a method much employed, particularly in early times; but the latest masters of the art preferred hatching, and there are specimens by old masters, Perugino, for instance, executed in that manner.

MINIÉ, CLAUDE ÉTIENNE, b. Paris, 1810; entered the army as a volunteer, and served in Algeria during several campaigns. He was made capt. in 1849, and in 1852 was appointed by Napoleon III. superintendent of the school of ordnance at Vincennes. In 1858 he resigned this post, and was appointed by the Egyptian government to superintend a manufactory of arms and a school of gunnery at Cairo. His invention of the Minié rifle was made about 1833, and adopted by the French government. It was the first practical introduction of the principle of expansion in the manufacture of firearms, and gave to the bullet a precision and range previously unknown to gunnery.

MIN'IM, the name of one of the notes in modern music, the value of which is the half of a semibreve.

MINIMS (Lat. *fratres minimi*, least brethren), so called, in token of still greater humility, by contrast with the *fratres minores*, or lesser brethren of St. Francis of Assisi (q.v.), an order of the Roman Catholic church, founded by another St. Francis, a native of Paula, a small town of Calabria, about the middle of the 15th century. Francis had, as a boy, entered the Franciscan order; but the austerities of that rule failed to satisfy his ardor, and on his return from a pilgrimage to Rome and Assisi, he founded, in 1453, an association of hermits of St. Francis, who first lived in separate cells, but eventually were united in the conventual life in 1474, and established in several places in Calabria and Sicily. Francis was also invited into France by Louis XI., and founded houses of his order at Amboise and at Plessis-les-Tours. In Spain the brethren took the name of "Fathers of Victory," in memory of the recovery of Malaga from the Moors, which was ascribed to their prayers. It was not till very near the close of the life of Francis that he drew up the rule of his order. It is exceedingly austere, the brethren being debarred

the use not only of meat, but of eggs, butter, cheese, and milk. Notwithstanding its severity, this institute attained considerable success; its houses, soon after the death of Francis (1502), numbering no fewer than 450. It has reckoned several distinguished scholars among its members; but in latter times the order has fallen into decay, being now limited to a few houses in Italy, the chief of which is at Rome. The superiors of convents in this order are called by the curious name of *corrector*, the general being styled *generalis corrector*. A corresponding order of females had its origin about the same time, but this order also has fallen into disuse.

MINING is a general term for the underground operations by which the various metals and other minerals are procured. It has been practiced to some extent from the remotest times, as is proved by the reference to it in the 28th chapter of the book of Job. In its proper sense, the art was certainly known to the ancient Phenicians and Egyptians, and also to the Greeks and Romans. Mining operations were carried on in Britain by the latter at the time of the Roman conquest. After the Norman conquest, Jews, and, at a later time, Germans were largely employed in our mines. The introduction of gunpowder as a blasting material in 1620, led the way to many improvements in mining; so also did the introduction of powerful engines for pumping water, about the beginning of the 18th century.

There are two principal methods of mining: one of which is adopted where the mineral occurs in veins or lodes, as copper and lead ore; and the other where the mineral occurs in more or less parallel beds, as coal. Mining in alluvial deposits is a third method, largely practiced in the gold regions of California and Australia, and includes the novel process of "hydraulic mining."

In mines like those of Cornwall and Devonshire, where most of the copper and tin of Great Britain, and also some of the lead, are obtained, the ores occur in veins filling cracks or fissures in the rocks. Such veins are termed lodes, to distinguish them from veins of quartz and other non-metallic minerals. Lodes are very irregular in size, and in the directions they take, though they usually follow one general line.

A lode consists of a main or "champion" lode and branches, called *feeders*, *shoots*, and *strings*. Mineral veins sometimes extend for several miles through a country; but they expand and contract so much, and split up into so many branches, that it is perhaps uncertain whether the same lode has ever been traced for more than a mile. Veins seldom deviate more than 45 degrees from a perpendicular line, and descend to unknown depths. They penetrate alike stratified and unstratified rocks. Those veins which run e. and w. have been observed to be the most productive.

Fig. 1 shows a section of a Cornish mine across the lodes *l, l, l, l; a* is the engine-shaft, in which are the pumps and the ladders for ascent and descent; *b, b* are *whim-shafts* for raising the ore, which is done by means of buckets. The adit, or day-level, is a long passage to which the water of the mine is pumped up and conveyed away. Some adits are made to traverse several mines. The great adit which drains the mines of Glennap and Redruth, in Cornwall, is 30 m. long. At *c, c, c*, are cross cuts, by which the workings on the different lodes are connected.

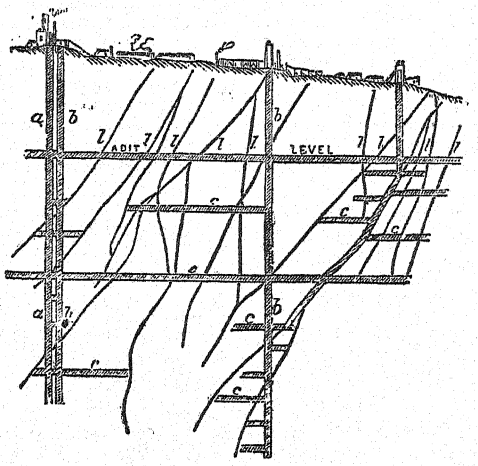

Fig. 1.—Cross-section of a Cornish Mine.

A horizontal section in the direction of a lode would show the horizontal galleries, termed *levels*, which are driven upon the lode, and small upright shafts, called *winces*. Levels are generally about ten fathoms (60 ft.) apart. They are rarely perpendicular above each other, as they follow the inclination of the vein. In the section, the richer portions of the lode, termed "bunches," are shown shaded; and where these have been removed, and their place filled with rubbish, angular fragments are represented. This is necessary to prevent the sides of workings from falling in. The bottom of the engine-shaft is the lowest portion of the mine. It is called the *sump*, and is the place where the water from the various levels and workings collects, in order to be pumped up to the adit. The galleries and shafts in an extensive mine are very numerous, making it altogether a very complicated affair. The shafts, however, have all distinct names, and the levels are known by their depth in fathoms, so that particular places are as easily found as streets in a town. The underground workings of the Consolidated mines, which are the largest in Cornwall, being a

conjunction of four mines, are 55,000 fathoms, or 63 m., in extent. In working out the lode between one level and another, the miner usually goes upwards, it being easier to throw down the ore than to raise it up. He works with the light of a candle, stuck with clay to the side of the mine. His tools are few—namely, a pick, a hammer, and some wedges where the vein is soft and friable; but it is generally hard enough to require blasting, in which case he uses a *borer* or *jumper*, and some smaller tools for cleaning and stemming the hole which is made. The ore is filled into wagons, and then drawn along the gallery to the shaft, to be raised to the surface in *kibbles*.

A vein may be 30 or 40 ft. thick, and so poor in ore as not to be worth working; again, it may be only a few inches thick, and yet its richness may amply repay the labor of extracting it. Three or four feet may be taken as the average of several kinds of veins. In extensive mines, portions of the ore are here and there left in the lode, so as to furnish a steady supply when other parts are unproductive. These are called *eyes*, and when they are afterwards removed, the operation is termed *picking out the eyes of the mine*.

The old plan of ascending and descending the mines by ladders, so destructive to the health of the miners, is still largely in use. The ladders are now about 25 ft. long, and set with a slope. There is a platform at the bottom of each called a *sollar*, with a man-hole in it leading to the next ladder beneath. Some of the Cornish mines are half a mile deep, so that it takes the miner an hour to reach the surface after he is done with his work; most of the journey being accomplished on wet, slippery ladders. The bad effects of the fatigue so produced are augmented by the fact that the men come from a constant temperature of 80° or 90° F. below, to one of perhaps 30° or 40° on the surface. Dr. J. B. Sanderson states, as the result of recent inquiries, that 90° F. is the highest limit of temperature consistent with healthy labor in a mine.

A great improvement on the ladder system is now in operation in several of the deep Cornish mines. It is a method first introduced into the deep mines of the Harz, and called the *fahr-kunst*. The plan of this "man-engine" is this. Two rods descend through the depth of the shaft, and upon these bracket-steps are fixed every 12 feet. The rods move up and down alternately through this distance by means of a reciprocating motion. If the miner wishes to ascend, he places himself on the lower step of the first rod, and is raised by the first movement of this rod to the level of the second step on the second rod, to which he now crosses. The next movement raises the second rod, and brings the second step up to the level of the third step of the first rod, to which he next crosses; and so, ascending stage by stage, he reaches the top. The descent is, of course, accomplished in the same way.

Some of the Cornish pumping-engines are very large and powerful. The cylinder of one of the largest is 7 ft. 6 in. in diameter. With the expenditure of one bushel of coal, it can raise 100,000,000 lbs. weight one ft. high; this is called its "duty." It lifts nearly 800 gallons of water per minute, and its cost was about £8,000.

In Cornwall the miners are divided into two classes: one of them called *tributers*, who take a two months' contract of a portion of the lode; the other called *tutmen*, who are employed in sinking shafts, driving levels, etc.

A detailed analysis of one of the largest Cornish copper mines, published some years ago, shows that in that year it produced, in round numbers, 16,000 tons of ore, realizing £90,000, and yielding a net profit of about £16,000. It employed about 700 miners, 300 laborers, 300 boys, and 300 women and girls. The cost for coal was £1800; for malleable iron and steel, £1300; for foundry castings, £2,000; for ropes, £1000; for candles, £1800; for gunpowder, £2,000; and for timber, nearly £3,000. The last mines regulation acts were passed in 1872 (amended in 1875). See MINES IN LAW.

Mining for Coal.—The minerals of the carboniferous formation, at least those which occur in beds or strata, as coal and clay ironstone, are mined, as has been already said, in a different way from metallic veins. Originally deposited in a horizontal position, they have been so altered by movements in the earth's crust, that they are rarely found so now. They are more generally found lying in a kind of basin or trough, with many minor undulations and dislocations. But however much twisted out of their original position, the different seams, more or less, preserve their parallelism, a fact of great service to the miner, since beds of shale, or other minerals, of a known distance from a coal seam, are often exposed when the coal itself is not, and so indicate where it may be found.

The great progress made of late years in the science of geology has made us so minutely acquainted with all the rock formations above and below the coal measures, that it is now a comparatively easy matter to determine whether, in any given spot, coal may or may not be found. Nevertheless, large sums are still occasionally, as they have in past times been very frequently, wasted in the fruitless search for coal, where the character of the rocks indicates formations far removed from coal-bearing strata.

When there are good grounds for supposing that coal is likely to be found in any particular locality, before a pit is sunk the preliminary process of "boring" (q.v.) is resorted to, in order to determine whether it actually does exist there, and if in quantity sufficient to make the mining of it profitable. The usual mode of "winning" or reaching the coal is to sink a perpendicular shaft; but sometimes a level or cross-cut mine, and at other times an inclined plane or "dook," is adopted. Before the introduction of

pumping-engines, all coal-workings were drained by means of a level mine called a *day-level*, driven from the lowest available point on the surface, and no coal could be wrought at a lower depth than this, because there were no means of removing the water.

When the shaft has been sunk to the necessary depth, a level passage, called the *dip-head*, or *main-level*, is first driven on each side, which acts as a roadway or passage, and, at the same time, as a drain to conduct the water, which accumulates in the workings, by means of a gutter on one side, to the lodgment at the bottom of the shaft. This level is the lowest limit of the workings in the direction of the dip, and from it the coal is worked out as far as is practicable along the rise of the strata. There are two principal methods of mining the coal. One is termed the "post-and-stall" or "stoop-and-room" system, and is used for thick seams; the other is called the "long-wall" system, and is adopted for seams under 4 ft. in thickness. In a mine wrought on the post-and-stall plan, the coal is taken out in parallel spaces of say 15 ft. wide, intersected by a similar series of passages at right angles. Between these "rooms," as they are called, "stoops" of coal, about 30 ft. each way, are left for the support of the "roof" of the seam. Larger stoops are left at the bottom of the shaft, in order to secure greater stability there. There is a modification of this plan adopted at Newcastle, called the "board-and-pillar" method, by which a certain number of the stoops or pillars are removed altogether, after which the roof falls in, and forms a mass of ruins, termed a "goaf."

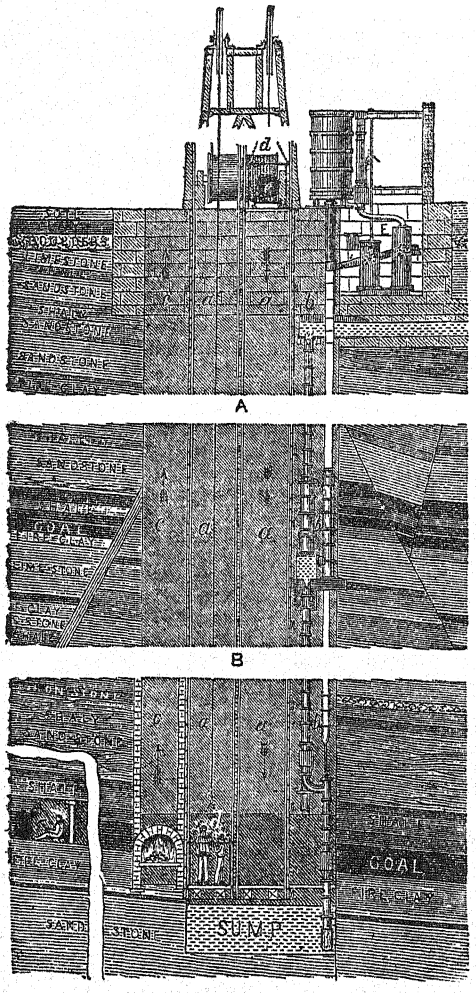

Fig. 2.—Vertical Section of the Shaft of a Coal-pit, with a Detached Portion, showing a Miner at work on the Coal Seam.

The *long-wall* system consists in extracting the entire seam of coal at the first working, the overlying strata being supported by the waste rock from the roof of the workings. It is necessary, however, to leave large stoops at the bottom of the shaft for its support, as in the stoop-and-room method. In long-wall workings, roads of a proper height and width require to be made for communication with the different parts of the mine.

The collier's usual mode of extracting the coal from its bed is this: With a light pick, he undercuts the coal-seam, technically termed "holing," for 2 or 3 ft. inwards, and then, by driving in wedges at the top of the seam, he breaks away the portion which has been holed. Blasting is occasionally, but not often resorted to. For the past ten years, machines, some for "holing" only, and others for both "holing" and hewing down coal-seams, have been more or less in use. They usually work with compressed air, but sometimes with steam or water. It is still premature, however, to express any decided opinion as to their efficiency as compared with hand-labor. The coal, when separated from its bed, is put on tubs or hutches, which are generally drawn by horses, but sometimes by engine-power, along the roads to the bottom of the shaft, and hoisted to the surface.

The shaft is perhaps the most important portion of a coal-pit, and the principal parts of one are shown in fig. 2. The upper part shows the pit-head arrangements, the central part shows the force-pump, etc., and the lower part shows the pit-bottom arrangements. To make the section complete, the reader must imagine a great depth to intervene at the gaps A and B. There are four divisions in this shaft: the two center ones, *a*, *a*, are used for sending up and down the men and the coal; the one on the right side, *b*.

contains the pump; and the remaining one on the left, *c*, is for withdrawing the vitiated air from the mine, and has usually a furnace at the bottom of it. In some pits a special shaft is applied to the ventilation, for which mechanical contrivances, such as ventilating fans, are now also partially introduced. Since the dreadful accident at the Hartley Colliery, in January, 1862, caused by the beam of the engine breaking and closing up the shaft, an act of parliament has been passed making it imperative to have two shafts, or at least two outlets, to every coal-mine, as a means of escape, in case of an accident to one of them.

The cages *d*, *d*, by which the colliers ascend and descend, are also used for raising the coal. They are merely square plats of timber, with rails across thom, for the convenience of running off and on the coal-hutches, *e*, and with a light iron frame, by which they are suspended to a flat wire-rope. On each cage there are iron clasps, which slide up and down on guide-rods. In the figure, two miners are shown standing on one cage at the bottom of the shaft, and the other is at the top, with a coal-hutch upon it. The accidents resulting from the raising and lowering of the cages are numerous; many of them happen by the carelessness of the engine-man in not stopping the cage when it reaches the mouth of the pit, and so allowing it to be upset by over-winding. Many accidents also happen from the rope breaking. To prevent this, numerous "safety-cages" have been invented, most of which depend on the action of a spring, which is held in a certain position while the cage is suspended by the rope; but should the latter snap, the spring is suddenly relieved, and then grasping the guide-rods, prevents the cage from falling. Other safety cages act by levers and clutches, but it is still disputed whether there is, on the whole, a decided advantage in using any of them, since they are all liable to get out of order. The man-engine, although not used in British collieries, is adopted in several on the continent, and is certainly the safest way of putting up and down men in a pit.

The steam-engine, E, works the pumps, in this case by a direct action, the pump-rods being attached to the piston-rod. The engine also winds up the cages, one of which ascends while the other descends—the barrel and other arrangements for which are shown in the figure.

The proper ventilation of any mine, but especially of a coal mine, is of very great importance. It clears the mine of the dangerous gases, fire-damp and foul-damp, dries the subterranean roadways, and furnishes the miners with a supply of pure air. Some idea of the general mode of ventilating a mine will be obtained by referring to Fig. 2, where the arrows pointing downward indicate the *downcast* shaft, and the arrows pointing upward, the *upcast* one. A number of doors and stops secure the traveling of the current in a proper direction, so as to reach the furthest recesses of the mine. It then returns by the upcast shaft, where, as has been already stated, it is usual to keep a furnace burning, to aid in withdrawing the impure air. It is very difficult, however, to secure efficient ventilation through all the zigzag windings of a mine; hence the frequent and sometimes terrible explosions of fire-damp, or light carbureted hydrogen, which explodes when mixed with a certain proportion of atmospheric air; hence, also, the occasional accumulation of foul-damp (carbonic acid) in some pits, which suffocates any one breathing it. This deadly gas is always produced in large quantity by an explosion of fire-damp, and chokes many who have survived the violence of the explosion. Many collieries are so free of fire-damp, that the miners work with naked lights, but in others it is necessary to use the safety lamp (q.v.).

Besides the already mentioned sources of accident, there is the sudden falling-in of pieces from the roof of the workings. The following summary, made up from H. M. inspector's returns, shows the number of lives lost, in proportion to the quantity of coal raised:

Total tons of mineral raised in Great Britain for the year 1876	148,989,385
Total number of lives lost in 1876	933
Average tons of mineral raised to each life lost	159,688

To show the magnitude of some of the large coal-mines, it may be stated that the Hetton colliery, in Durham, yields 800,000 tons in the year, employs about 1000 men and 300 boys underground, and 300 people at the surface. The Monkwearmouth pit, near Newcastle, is 1900 ft. deep, and its face-workings are 2 m. from the bottom of the shaft. Rosebridge colliery, near Wigan, has the deepest shaft in England, being nearly 2,500 ft. deep. The sinking of some of the more difficult shafts has cost from £50,000 to £100,000 each.

MINING. See APPENDIX.

MINING CORPORATIONS, companies incorporated under national, state, or colonial law, to mine for the precious metals or other minerals. Such companies are sometimes permitted also to manufacture, or to do a milling or reduction business, in connection with mining; or to engage in transportation—as of coal from the mine to the market. Mining property is held by purchase and absolute ownership, or by lease. In the Dominion of Canada leases are granted by the queen, and a royalty on the yield paid to the government. The number of mining companies in the United States in good standing, reported on Jan. 1, 1881, was 212, divided as follows as to the location of the mines: California 37, Colorado 80, Montana 4, Dakotah 11, North Carolina 5, Nevada 31, Ari-

zona 15, Maryland 1, Utah 11, New York 1, Georgia 3, Michigan 5, Mexico 2, Arkansas 2, New Mexico 1, Virginia 3. These mining properties were capitalized in the sum of $931,000,000. As an illustration of the extent to which mines were over-capitalized, it may be mentioned that the market-value of the properties of 95 of these mines capitalized in $745,000,000, estimated on the selling prices of the various stocks, was (in round numbers) $60,000,000, or eight per cent of the capital; amounting to the fact that the stocks in question were at the time when the figures were procured selling on the mining-stock exchange of New York city at the discount of 92 per cent.

MINISTER, a public functionary who has the chief direction of any department in a state. See MINISTRY. Also the delegate or representative of a sovereign at a foreign court to treat of affairs of state. Every independent state has a right to send public ministers to, and receive them from, any other sovereign state with which it desires to preserve relations of amity. Semi-sovereign states have generally been considered not to possess the *jus legationis*, unless when delegated to them by the state on which they are dependent. The right of confederated states to send public ministers to each other, or to foreign states, depends on the nature and constitution of the union by which they are bound together. The constitution of the United Provinces of the Low Countries and of the old German empire preserved this right to the individual states or princes, as do the present constitutions of the German empire and Swiss confederation. The constitution of the United States either greatly modifies or entirely takes away the *jus legationis* of each individual state. Every sovereign state has a right to receive public ministers from other powers, unless where obligations to the contrary have been entered into by treaty. The diplomatic usage of Europe recognizes three orders of ministers. Ministers of the first order possess the representative character in the highest degree, representing the state or sovereign sending them not only in the particular affairs with which they are charged, but in other matters: they may claim the same honors as would belong to their constituent, if present. This first class of diplomatic agents includes papal legates and nuncios, and ambassadors ordinary and extraordinary. A principle of reciprocity is recognized in the class of diplomatic agents sent. States enjoying the honors of royalty send to each other ministers of the first class; so also in some cases do those states which do not enjoy them; but it is said that no state enjoying such honors can receive ministers of the first class from those who are not possessed of them.

Ministers of the second and third order have not the same strictly representative character; their representation is not held to go beyond the affairs with which they are charged. They are, however, the natural protectors of the subjects of the state or country sending them in the country to which they are sent. Ministers of the second class include envoys, whether these are simply so styled, or denominated envoys extraordinary, and also ministers plenipotentiary. The third class of ministers does not differ from the second in the degree of their representative character, but only in the diversity of their dignity, and the ceremonial with which they are received. This class comprehends ministers, ministers resident, ministers chargés d'affaires, such consuls as are possessed of a diplomatic character, and those chargés d'affaires who are sent to courts to which it is not wished to send agents with the title of minister. Ministers of the third class have, for the most part, no letters-credential from the sovereign, and are accredited only by letters to the foreign minister or secretary of the country to which they are sent.

Besides these orders of ministers, there are other diplomatic agents occasionally recognized—as deputies sent to a congress or confederacy of states, and commissioners sent to settle territorial limits or disputes concerning jurisdiction. These are generally considered to enjoy the privileges of ministers of the second and third order. Ministers-mediators are ministers sent by two powers, between which a dispute has arisen, to a foreign court, or congress, where a third power, or several powers, have, with the consent of the two powers at variance, offered to mediate between them.

Diplomatic agents, except, as already mentioned, those of the third class, are accredited by a letter to the sovereign of the country to which they are sent. The letter of credence is usually dispatched under a *cachet volant*—i.e., a seal which does not close the letter; or else, in addition to the principal letter, an authenticated copy is sent, which the diplomatic agent on his arrival presents to the minister or secretary for foreign affairs, as his right to demand an audience of the sovereign; the original is presented to the sovereign. Ministers sent to a congress or diet have usually no credentials, but merely a full power, of which an authenticated copy is delivered into the hands of a directing minister, or minister-mediator. A minister of the first class is received to both public and private audiences by the sovereign to whom he is accredited; a minister of the second class generally to private audiences only. Diplomatic agents are entitled to conduct negotiations either directly with the sovereign, or with the minister or secretary for foreign affairs. The latter course is the more usual, and generally the more convenient.

The title "excellency" has since the peace of Westphalia been accorded to all diplomatic agents of the first class; and in some courts it is extended to ministers of the second class, or at least those sent by the great powers. See AMBASSADOR, ENVOY, CONSUL. Under AMBASSADOR the immunities and privileges enjoyed by diplomatic agents are explained.

MINISTER, CHRISTIAN. See CLERGY, *ante*.

MINISTER,—MINISTRY (*ante*). I. FUNCTIONARY DIPLOMATIC. By the American system ministers to exercise diplomatic functions near foreign courts are appointed by the president and confirmed by the senate of the United States. They are accredited by letter to the sovereign of the country to which they are appointed, and are permitted certain immunities and privileges: being entitled to be addressed as "excellency," and conceded exemption from the operation of municipal law. The United States send no envoys of the rank of ambassadors, permanently accredited to foreign courts; but have not infrequently conferred the rank and authority in the case of special missions. See AMBASSADOR, *ante*. II. FUNCTIONARY EXECUTIVE. In the United States government the executive offices are under the immediate official direction and control of the heads of the departments, including those of state, treasury, interior, war, post-office, navy, justice, and agriculture. Seven of these officials have seats in the cabinet or council of advisers of the president, and are termed "the cabinet." They are the secretaries of state, war, the treasury, the navy, and the interior; the postmaster-general, and the attorney-general, or head of the department of justice. These officials are appointed by the president and confirmed by the senate; their duty is to administer or execute the functions of their respective offices under the direction of the president, to whom they are immediately responsible and to whom they report annually; and from time to time on special subjects if so desired by him. They hold their offices at the will of the president, who may request their resignations if the good of the public service shall seem to require it. As an advisory council, they assemble at the call of the president, or at stated times, for conference, to enunciate opinions or to answer questions. There is nothing, however, in the constitution or elsewhere in American law which renders it obligatory on the president to employ them in this manner, though custom has made it usual and convenient so to do. Excepting to the president for the proper performance of their official duties, they have no responsibilities; and in no particular except in the nature of these duties do they resemble the ministers of Great Britain or those of the European powers. See CABINET, *ante*.

MINISTRY, the body of ministers of state, or persons to whom the sovereign or chief magistrate of a country commits the executive government.

It is a principle of the constitution of Great Britain, that "the king can do no wrong;" that is to say, the sovereign personally is irresponsible for his acts, the real responsibility resting with the administrative government. The "king's council," or PRIVY COUNCIL, were the earliest advisers of the sovereign in matters of state; but when this body came, in the course of time, to be found too large for the dispatch of business, its duties were transferred to a small committee of privy councilors selected by the king. As late as in Charles I.'s time, all the more important resolutions of the crown were taken after deliberation and assent of the privy council. An unsuccessful attempt was made in the reign of Charles II. to restore the council to its original functions. Its numbers were limited to thirty; and it was intended that this limited council should have the control of the whole executive administration, superseding any interior cabinet. But the council was found too extensive for an effectively working ministry, and the former arrangment was restored. The CABINET or MINISTRY is now but a committee of the privy council; and its exclusive right to discuss and determine the plans and business of the government has been often said not to be recognized by the law, a position which, however, was disputed by lord Campbell, who maintained that, "by our constitution, it is in practice a defined and acknowledged body for carrying on the executive government of the country." Proclamations and orders still issue from the privy council; and it is occasionally assembled to deliberate on public affairs, when only those councilors who are summoned attend. The cabinet is a merely deliberative body; its members collectively have no power to issue warrants or proclamations; but all important measures which engage the attention of the government, whether regarding matters domestic, foreign, or colonial, and all plans of action, whether purely administrative, or to be carried out in parliament, must be proposed, considered, and adopted by the cabinet. The sovereign intrusts the formation of a ministry to a statesman, who selects for the members of his cabinet those who are attached to his political views. He generally places himself at the head of the government as first lord of the treasury, and in popular language, he is called the premier, or prime minister. The lord chancellor, the chancellor of the exchequer, the secretaries of state for home, foreign, colonial, and Indian affairs, the secretary at war, and the president of the council, are necessarily members of the cabinet; and with them are associated the heads of various other important departments of government, including generally the first lord of the admiralty, the president of the board of trade, the postmaster-general, the president of the poor-law board, the chancellor of the duchy of Lancaster, and occasionally the chief secretary for Ireland. The premier has sometimes held the office of chancellor of the exchequer in conjunction with that of first lord of the treasury. A privy councilor of great political weight is sometimes called into the cabinet without office, and takes the post of lord privy seal. Her majesty's ministers include the following, who have usually no seat in the cabinet: the chief secretary for Ireland, the first commissioner of works, the vice-president of the board of trade, the vice-president ot the committee on education, the commander-in-chief, the lord chamberlain, the steward, the master of the horse, the

master of the buckhounds, the comptroller of the household, the lord lieutenant of Ireland, the attorney-general and solicitor-general of England, the lord advocate and solicitor-general of Scotland, and the attorney-general and solicitor-general of Ireland. Occasionally, but exceptionally, the commander-in-chief, and the lord chief justice of England, have been members of the cabinet. A ministry is often spoken of as the ministry of the person who is at its head.

Meetings of the cabinet are held on the summons of any one of its members, usually at the foreign office. Its proceedings are secret and confidential, and no record is kept of its resolutions, which are carried into effect by those of its members to whose departments they severally belong. As the acts of a ministry are at all times liable to be called in question in parliament, it is necessary that the heads of the chief departments should have seats in either house, in order to be able, when required, to give prompt explanations.

A government exists only so long as it can command the confidence of parliament. The sovereign has the power to dismiss his ministers whenever they cease to possess his confidence, but such a change would be useless without the support of the house of commons, who, by withholding their support, could paralyze all the functions of government. A sovereign has sometimes got rid of a ministry with whose policy he was dissatisfied, by dissolving parliament, and appealing to the country. When a ministry cannot command the confidence of parliament, they resign, and a statesman of some other political party is sent for by the sovereign, and authorized to form a new cabinet. All the adherents of a ministry filling political offices resign along with it, as also the great officers of the court, and those officers of the royal household who have seats in either house of parliament. Sometimes officers holding lucrative appointments which do not necessitate resignation, have retired, as a manifestation of adherence to their political friends. In addition to the ministers already named, the following adherents of the ministry go out of office on a change of government: the three junior lords of the treasury, the two secretaries of the treasury, the four parliamentary under-secretaries of state, the paymaster-general, the master-general of the ordnance, the surveyor-general of the ordnance, the five junior lords of the admiralty, the first secretary of the admiralty, the chief commissioner of Greenwich hospital, the president and parliamentary secretary of the poor-law board, the president of the board of health, the vice-chamberlain, the captain of the gentlemen-at-arms, the captain of the yeomen of the guard, the lords in waiting, the mistress of the robes, the treasurer of the household, the chief equerry, or clerk marshal, the judge advocate-general, and the lord chancellor for Ireland. The private secretary to a minister loses office on a change, his appointment being a purely personal one; and some changes are generally, though not always made in ambassadors extraordinary.

In 1839, when viscount Melbourne's ministry resigned, sir Robert Peel, who was intrusted by the queen with the formation of a new ministry, proposed that, in order to give public proof of her majesty's confidence, the change should include the chief appointments held by the ladies of her majesty's household. The queen, counseled by lord Melbourne, refused her consent to this proposal, on the ground of its being contrary to the latest precedents of the reign of queen Anne. Sir Robert, however (with whose opinion the duke of Wellington expressed concurrence), considered the change a necessary one; and as he refused to undertake the formation of a government without its being adopted, the result was that lord Melbourne and his colleagues were reinstated. At a council held on their resuming office, it was resolved "That for the purpose of giving to the administration the character of efficiency and stability, and those marks of the constitutional support of the crown that are requisite to enable it to act usefully to the public service, it is reasonable that the great offices of the court, and situations in the household held by members of parliament, should be included in the political arrangements made in a change of the administration. But they are not of opinion that a similar principle should be applied or extended to the offices held by ladies in her majesty's household."

MIN'IUM (Lat. red-lead). See LEAD.

MINK, *Mustela lutreola*, a species of weasel inhabiting the northern parts of Europe and Asia; very similar to which in characters and habits is another species, by some regarded as only a variety of the same, the mink or VISON (*M. vison*) of North America, abundant in almost every part of that continent. Both inhabit the neighborhood of streams, lakes, and marshes; have semi-palmated feet, are expert swimmers and divers, and prey on fishes, frogs, and other aquatic animals, as well as on birds, rats, mice, etc. They are covered with a downy fur, interspersed with longer and stronger hairs: the color is brown, with more or less of white on the under parts. The American mink is generally larger than that of the old world, being often more than 18 in. from the nose to the root of the tail, whilst the latter is seldom more than 12. It has also a more bushy tail. It is very active and bold, and often commits great depredations in poultry-yards, carrying off a fowl with great ease. Unlike most of its congeners, it is easily tamed, and becomes much attached to those who caress it. In domestication it ceases to regard the inmates of the poultry-yard as prey. It emits an unpleasant odor only when irritated or alarmed. The fur of the mink is valuable. See WEASEL.

MINNEAPOLIS, a city in s.e. Minnesota, incorporated 1867; enlarged by the annexation of the city of St. Anthony, 1872; situated at the falls of St. Anthony, 10 m. w. of St. Paul; pop. '80, 46,887. It is built on a broad plateau, through which flows the Mississippi river, overlooked by bold bluffs, which command a view of the surrounding country, noted for its picturesque scenery. At the falls of St. Anthony the river makes a descent of 50 ft. within a mile (80 ft. within the limits of the city), and has a perpendicular descent of 18 feet. It is crossed by 4 bridges, including a suspension bridge built in 1876; and in the vicinity are lakes Cedar, Calhoun, and Harriet. It is supplied by means of the river with extensive water-power, which is utilized by immense manufactories and mills. The value of the lumber sawed in one year was $2,948,335; that of flour made in one year was $7,320,410. It has grocers who do a business of from $4,000,000 to $5,000,000 a year; and large dry-goods and commercial houses. There was expended in the city, for building and improvements, in one year, $1,729,700. The leading industries are lumber and flour, and among its flour-mills is one with 40 run of stone—the largest in the country. An immense amount of grain is milled; other industries are the manufacture of iron machinery, engines and boilers, water-wheels, agricultural implements, sashes, doors, and blinds, beer, cotton and woolen goods, furniture, barrels, boots and shoes, paper, linseed-oil, etc. It has pork-packing establishments, and a large number of saw-mills. It has been a city of rapid growth, and has an important wholesale trade, which is constantly increasing. It is on the Chicago, Milwaukee and St. Paul railroad, at the junction of the St. Paul and Pacific and the Lake Superior and Mississippi with the Minneapolis and St. Louis line, all of which roads transport a large amount of freight, which is increasing yearly. It has a line of steamers to St. Cloud. It is regularly laid out, with avenues 80 ft. wide, crossed by streets at right angles, which are shaded by two rows of trees; is lighted by gas; is well sewered; and has a public park. It has 10 wards, a mayor, and board of aldermen of two members from each ward, a police force, and a fire department. There are 11 banks—6 national, with an aggregate capital of $1,025,000. Among public buildings are a court-house, a city hall erected in 1873, an academy of music, and an opera-house. There are 65 churches. The athenæum has a library of 8,000 vols. Minneapolis is the seat of the university of Minnesota (non-sectarian, and open to both sexes), organized in 1868, and having a library of 10,000 vols.; and the Augsburg theological seminary (Lutheran), established by the Scandinavians of the n.w., with a library of 1100 vols.; also Hamline university (Methodist). It has 14 newspapers—2 Norwegian, 1 German; and 2 semi-monthly periodicals, 1 Norwegian. The falls of Minnehaha (laughing water) are 3 m. distant.

MINNEHAHA, a river and fall in s.e. Minnesota, near the station of Minnehaha on the St. Paul and Pacific railroad, one-half mile from the Mississippi river and a short distance from Minneapolis. Considerable interest attaches to this cascade, it being the scene of a legendary romance wrought into the story of Longfellow's poem of *Hiawatha*. The river Minnehaha flows over a limestone cliff, making a sudden descent of 60 ft., and the story runs that Minnehaha, an Indian maiden crossed in love, here took the fatal leap. Minnehaha, in Dakota language, signifies laughing water.

MINNEHAHA, a co. in s.e. Dakota, having the state-line of Minnesota for its e. boundary; drained by the Big Sioux river and small affluents; 800 sq.m.; pop. '80 8,252—5,502 of American birth, 48 colored. It has Beaver lake and other small lakes in the n.w. Its surface is generally rich level prairies with little timber, but very productive where under cultivation. It is intersected by the Sioux City and St. Paul railroad, and its county seat contains a U. S. land office. Capital, Sioux Falls.

MINNESINGERS, a designation applied to the earliest lyric poets of Germany in the 12th and 13th centuries, and derived from the word *minne*, or love, which was at first the predominating, and almost sole subject treated of in their productions. The works of the minnesingers are for the most part superior to those of their more generally known contemporaries, the troubadours, both in regard to delicacy of sentiment, elegance and variety of rhythmical structure, and grace of diction. Henry of Veldig, who flourished in the beginning of the 12th c. at the court of the Swabian, Frederick Barbarossa, emperor of Germany, is regarded as the father of the minnesingers, and Walther von der Weide, who was born about 1170, as the last of this great vocal band, which included emperors, princes, nobles, and knights. Many of their productions have of course perished, although, in addition to a very large collection of poems by anonymous minnesingers, we still possess some remains of the songs of more than 150 known composers. Among the most celebrated of these, special notice is due to Wolfram von Eschenbach (q.v.), Henry von Ofterdingen, Hagenaue, Hartmann von der Aue (q.v.), Gottfried von Strasburg (q.v.), Otto von Botenlauben, Truchsess von St. Gall, and Ulrich von Lichtenstein—men of noble houses, who, although they belonged to every part of Germany, wrote almost exclusively in the Swabian dialect, which, during the brilliant days of the Fredericks and Conrads of the house of Swabia, was the language of the court in Germany. Among the few other forms of German employed by the minnesingers, the one next in favor was the Thuringian, adopted in compliment to Hermann, landgraf of Thuringia, who, next to the princes of the Swabian dynasty, was the most munificent patron of the minnesingers during the period of their renown, in the early part of the 13th century. Besides songs in praise of women, the minnesingers composed odes on public or private

occasions of lament or joy, distiches or axioms, and *wachtlieder*, or watch-songs, in which the lover was represented as expostulating with the watchman, who kept guard at the gate of the castle within which his lady-love was imprisoned and trying to persuade him to grant him admittance to her presence. These songs and odes were recited by the composer, to his own accompaniment on the viol; and as few of the minnesingers could write, their compositions were preserved mostly by verbal tradition only, and carried by wandering minstrels from castle to castle throughout Germany, and even beyond its borders. As the variety of rhythm and complicated forms of versification affected by the minnesingers, more especially towards the decline of their art, rendered it difficult to retain by memory the mass of minnesong which had been gradually accumulated, these itinerant musicians finally made use of written collections, a practice to which alone we are indebted for the many beautiful specimens of early German lyrical poetry which we yet possess. The glory of the minnesingers may be said to have perished with the downfall of the Swabian dynasty, under which greater liberty of thought and word was allowed among Germans than they again enjoyed for many ages; and in proportion as the church succeeded in reasserting its sway over the minds of men, which it had lost under the rule of the chivalric Fredericks, freedom of speech and action was trammeled, and song and poetry contemned. Paraphrases of Scripture, hymns, and monkish legends, took the place of the chivalric songs of the nobly born minnesingers, and German poetry was for a time almost annihilated.

In the 14th c., the art of minnesong was partially revived, although under a rude and clumsily elaborated form, by the *master-singers*, a body of men belonging to the burgher and peasant classes, who, in accordance with their artisan habits, formed themselves into guilds or companies, which bound themselves to observe certain arbitrary laws of rhythm. Nuremberg was the focus of their guilds, which rapidly spread over the whole of Germany, and gained so firm a footing in the land, that the last of them was not dissolved at Ulm till 1839. As the title of master was only awarded to a member who invented a new form of verse, and the companies consisted almost exclusively of uneducated persons of the working-classes, it may easily be conceived that extravagances and absurdities of every kind speedily formed a leading characteristic of their modes of versification; attention to quantity was, moreover, not deemed necessary, regard being had merely to the number of the syllables, and the relative position and order of the verses and rhymes. Their songs were lyrical, and sung to music; and although, as before remarked, each master was bound to devise a special *stole* or order of rhymes for each of his compositions, these stoles were subjected to a severe code of criticism, enacted by the *tabulatur*, or rules of the song-schools. Among the few masters who exhibited any genuine poetic feeling, the most noted were Heinrich Mügeln, Michael Behaim, and the Nuremberg shoemaker, Hans Sachs, who prided himself on having composed 4,275 *bar* or master songs. See Tieck's *Minnelieder* (1803); Taylor's *Lays of the Minne and Master Singers* (Lond. 1825); and Von der Hagen's *Minnesänger* (4 vols. 1838).
